

	Issue	Total	Report	Solution
1.	Student Identification	224/302	This aspect aims to capture the number of students the team had a visual of this new term... together with their laptop if they have one. 224 students (74%) out of the remaining 302 enrolled students (minus former Primary 6) were physically identified by the team. In total the best approximation of the number of students at Galadima (i.e. including those who are yet to resume and all new students) is 362.	
2.	Serial Number Match	159/224	159 XOs were matched. This means that 71% of the identified pupils have laptops that match the laptops we had originally assigned to them. A match is decided based on a positive comparison of the serial number on the machine each student presented and their originally assigned / recorded XO serial. Possible reasons for inconsistency included mistaken switches (which we rectified), illegible serials, laptop left at home or theft.
