I think the breadth of the data we receive will be enhanced if everyone that can be spared in the Dos group participates in this DR Hammer Fest

This includes;
 Product marketing; program management; development and User Ed
 We would not touch anyone whose participation would cause another schedule to be broken big time and all non-test participants would be limited to 2 or 3 days of time. Maybe even offer a prize to the person turning up the most verified anomalies.

This is pretty important. You should also do this before installing bambi - if you have a corrupted disk, adding bambi wont help.

Also, I run a dos prompt VM and frequently do a chkdsk. DO NOT do chkdsk /f, just chkdsk on each drive you are caching. If you see lost clusters, dont worry too much - there are lots of valid cases where this is ok. (like an app has written data to the disk but hasn't closed the file yet.) If you exit from windows and you still have lost clusters, then get scott or chuck. If you see anything worse like cross linked files or other dire sounding problems, don't do anything - get scott or chuck.

By the way, I'm running bambi on my vmail machine and did an expunge which took about 1/5 th the time it takes with smartdrv.
