CONFIDENTIAL

The standard response is: Windows is only tested with MS-DOS operating systems. DR-DOS claims to be 100% compatible with MS-DOS, so if that is true, then the user shouldn't have any problems.

There is really nothing we can do.

What can we tell a customer about compatibility or non with DR DOS 6?
I just had one of these calls, and he said he was going to change to
DOS 5 so I pushed that. Can we give them a workaround, or tell them to
buy MS-DOS 5?
