Here is the current contents of the bug database, sorted by severity.
 The priority field, the second column in this list, reflects current
 thinking on the bug: pri. 1 means the fix is in hand and has been
 approved by the war team; pri. 2 means the code fix is understood, but
 war team approval has not yet been obtained; no priority means the bug
 is not yet understood well enough to know if a fix is available; pri. 4
 indicates bugs that we do not expect to fix for DOS 5.0, but want to
 do further investigation on before we resolve.

sure we can talk to them about this issue tomorrow.
is this the windows hanging issue or is there something new?

One BIG issue I forgot to bring up. This should be on the
ballmer/reiswig agenda and be considered a MAJOR issue.

We can also use this as a bit of a diversion on the 3.1
sources.

This should be brought up tomorrow. Can it be done in the
call you have
scheduled to update them on the 3.1 sources?

Andy

Its the same issue--that a 4 page readme isn't going to solve the
problem and MS is going to take a massive support hit when the aloha
hits the streets.
