I like many many of the qualities of the '3D' look in 6 and 7
but like David am not sure that I like the heavy marble either.

I offer a PPT file for your choosing pleasure.

Subject: DR Dos review
Date: Fri Sep 20 08:45:42 PDT 1991

Quick application testing:

The applications testing results were as follows:

386Max - Was compatible with DR Dos and its default config.sys parameters
reported 624K of available conventional memory after loading.

Fastback - Was compatible with DR Dos. Did not require any special
installation with DR's emm386.sys loaded.

Lotus Metro - Was compatible with DR Dos. Did not require any special
setup.

RBC 003004

Lotus 123 3.1 - Was compatible with DR Dos. No special setup required.
Was able to use application with the TaskMax without incident.

Qemm386 - Was compatible with DR Dos and its default config.sys parameters
reported 622K of available conventional memory after loading.

Software Carousel - I was not able to successfully install this application
and DR Dos, the machine would lock up during the install process. This
app would install under Dos 5.0a.

Turbo Debugger 386 - Was compatible with DR Dos. I installed this under
DOS 5, but did not have to reinstall when I installed DR Dos.

For the most part, DR Dos ran okay. However, the user is required to
modify the emm386.sys line with the /WINSTD switch even though install
asks if your plan to run windows in statdard mode. Handling of standard
(Not ready errors, invalid drive, etc.)"DOS" errors is a little different.

See you at the velodrone at 9. I took a class with Dick
Rayray (sp?).

And it isn't suppose to rain this weekend, it is just suppose
to be cloudy and in the mid 60's—perfect riding weather.

I should be good for a short ride at 9. Might even drag brad along if
there's
no chance of clouds or drizzle.

So who taught the track class?
