I believe that this is a major problem because companies like Psion, Intel, and my embedded customers have been using FMFS 1.0 with older MS-DOS version such as MS-DOS ROM Version 3.22. We don't how many OEMs have been using FMFS 1.0 and will be using FFS with older versions of MS-DOS because Intel, Curtis, Databooks and Annabooks have sold a number of their Flash development kits with FMFS 1.0.

Because of MS-DOS ROM Version 5.0's size, I don't think that general purpose palmtop people like Psion and HP will be switching from their current MS-DOS Versions with their current systems. HP might not be using FMFS 1.0 with their HP95LX but FFS makes this more attractive for their MS-DOS ROM Version 3.22 HP 95LS. In a number of embedded systems, the OEM will not change the version of MS-DOS that they ROM'd.

I say that you should at least support 3.22 or higher.

BradSI claims that there is no need to support any version of MS-DOS other than 5.0 on the Flash File System. You two were the ones asking for this support. Unless you can come up with hard facts pretty soon, I'll have to drop this support. Please let me know asap.

thx
Fernando

Subject: Win31 Launch "Post-Mortem" has shipped
Date: Tuesday, June 02, 1992 11:57AM

Winmktg is distributing to product/mktg/senior management a comprehensive operations review of the activities conducted during the Win31 launch.

These reviews were conducted jointly by windows marketing and the 30 different program/group owners. Each review covers launch objectives, status against objectives, specific activities, evaluation of activities, and recommendations for future launches for the specific program/group.

The document should serve as a useful reference for anyone conducting a highly integrated product launch.

Separate reviews to assess program cost and impact of major launch programs (eg, upgrade program and seminars) will be conducted following collection of research data.

If you need a copy of this document please contact your group manager.
