ROMDOS is the target for next week's code review. Pickings are pretty slim, since most of the work was modification to existing code (which was, and still is, far too ugly for review by humans). There is a small bit -- the header and init code for the ROM module -- which is new, so I put that up in the usual place. Actually, a good deal of this was written by John for ROMDOS1, so if there is anything particularly good, I can't take credit for it.

Subject: ROMDOS 2 DBCS source merge...
Date: Sun Jun 28 13:22:48 PDT 1992

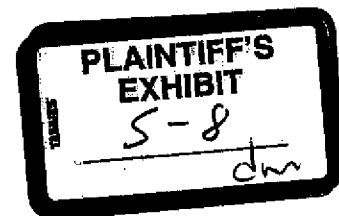

What shall we do about the DBCS stuff? My inclination is that we should just have Inagawa merge the stuff into the tree now. He did this earlier in the DOS and COMMAND, so I don't think we have to worry about him working on the tree directly. The alternative is to get the changed sources from him and merge them in ourselves (yuck).

I think jodys forwarded my email to you. Please let me know how and where to get those source codes.
Thanks.

Not knowing his record, I am nervous about letting him party on our tree. I rather see him follow the rules we gave him for DOS 4.01, meaning that he doesn't merge anything in until he has verified that it doesn't break compatibility. I'd also prefer to have you code review his stuff before it is merged in.
