

1. (Three Times Amended) A communication device including a processor having instructions that execute on the processor and that comprises:

a message manager program for accepting and dispatching messages;

at least one application program for handling and presenting messages; and

at least one message client program, each message client program corresponding to a particular application program, that receives messages from the message manager program and provides them to the corresponding application program,

wherein the message manager program accepts a registration from each message client program including at least one rule and at least one attribute to which the rule is to be applied for new messages, and

wherein the at least one attribute including a handled/not handled attribute of messages, the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message.

11 12. (Three Times Amended) A communication device including a processor having instructions that execute on the processor and that comprises:

a set of first instructions for message management;

at least one set of second instructions for interacting between message and a user; and

at least one set of third instructions, each set of third instructions corresponding to a particular set of second instructions, for accepting a message from the first instructions and providing the message to the corresponding set of second instructions, wherein

the first instructions accept a registration from each set of third instructions, the registration including at least one rule and at least one attribute to which the rule is to be applied for new messages, the at least one attribute including a handled/not handled attribute of messages, and the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message.

REMARKS

Claims 1, 2, and 4 through 12 are pending in this application. Claims 1 and 12 are hereby amended.

Claims 1, 2, and 4 through 12 are rejected under 35 U.S.C. §103(a) as being unpatentable over U.S. Patent No. 5,742,905 to Pepe, et al. ("Pepe, et al. patent") in view of U.S. Patent No. 5,335,347 to Foss, et al. ("Foss, et al. patent"). Claims 1 and 12 are hereby amended to provide "the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message". Support for the above recitation is provided at page 6, line 9, through page 9, line 6, of the specification.

In contrast, col. 13, line 65, through col. 14, line 7, of the Foss, et al. patent states "[u]pon receipt of local selection results from the selecting means 14 of the receiving switch 10, indicating failure to select local handler processes 52 and joined switches (if applicable), the updating means 18 of the receiving switch 10 generates reply messages 67 to scoped request messages 64 and discards scoped notice messages 65. The updating means 18 of the receiving switch 10 generates the reply messages 67 by updating the scoped request messages 64. Updates comprise updating message state attributes to "Failed", and message failure reason attributes". Thus, the Foss, et al. patent does not describe or suggest a handled/not handled attribute of messages that is based on attempted delivery/refused deliver or processing/refused processing of

a particular message, as required by amended claims 1 and 12. Likewise, the Pepe, et al. patent does not describe or suggest a handled/not handled attribute of messages, as required by amended claims 1 and 12. Therefore, amended claims 1 and 12 distinguish patentably from the Pepe, et al. patent, the Foss, et al. patent, and the combination of these patents.

Claims 2 and 4 through 11 depend from and include all limitations of independent claim 1 as amended. Therefore, claims 2 and 4 through 11 distinguish patentably from the Pepe, et al. patent, the Foss, et al. patent, and the combination of these patents for the reasons stated above for amended claim 1.

In view of the above, reconsideration and withdrawal of the rejection of claims 1, 2, and 4 through 12 are respectfully requested.

No amendment made was related to the statutory requirements of patentability unless expressly stated herein. Also, no amendment made was for the purpose of narrowing the scope of any claim, unless Applicants have argued herein that such amendment was made to distinguish over a particular reference or combination of references.

Attached hereto is a marked-up version of the changes made to the claims by the current amendment. The first page of the attached page(s) is captioned "**VERSION WITH MARKINGS TO SHOW CHANGES MADE**".

It is submitted that the claims clearly define the invention, are supported by the specification and drawings, and are in a condition for allowance. A Notice of Allowance is

respectfully solicited. Should the Examiner have any questions or concerns that may expedite prosecution of the present application, the Examiner is encouraged to telephone the undersigned.

Respectfully submitted,
Zurcher, Rodd, et al.

VERSION WITH MARKINGS TO SHOW CHANGES MADE

In The Claims:

Claims 1 and 12 are amended as follows:

1. (Three Times Amended) A communication device including a processor having instructions that execute on the processor and that comprises:
 - a message manager program for accepting and dispatching messages;
 - at least one application program for handling and presenting messages; and
 - at least one message client program, each message client program corresponding to a particular application program, that receives messages from the message manager program and provides them to the corresponding application program,

wherein the message manager program accepts a registration from each message client program including at least one rule and at least one attribute to which the rule is to be applied for new messages, and

wherein the at least one attribute including a handled/not handled attribute of messages, the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message.

12. (Three Times Amended) A communication device including a processor having instructions that execute on the processor and that comprises:

a set of first instructions for message management;

at least one set of second instructions for interacting between message and a user; and

at least one set of third instructions, each set of third instructions corresponding to a particular set of second instructions, for accepting a message from the first instructions and providing the message to the corresponding set of second instructions, wherein

the first instructions accept a registration from each set of third instructions, the registration including at least one rule and at least one attribute to which the rule is to be applied for new messages, the at least one attribute including a handled/not handled attribute of messages, and the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message.

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

All claims being allowable, PROSECUTION ON THE MERITS IS (OR REMAINS) CLOSED in this application. If not included herewith (or previously mailed), a Notice of Allowance and Issue Fee Due or other appropriate communication will be mailed in due course. **THIS NOTICE OF ALLOWABILITY IS NOT A GRANT OF PATENT RIGHTS.** This application is subject to withdrawal from issue at the initiative of the Office or upon petition by the applicant. See 37 CFR 1.313 and MPEP 1308.

1. ☒ This communication is responsive to amendment filed on 02/13/2002.
2. ☒ The allowed claim(s) is/are 1-2 and 4-12 renumbered as 1-11.
3. ☐ The drawings filed on _____ are acceptable as formal drawings.
4. ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d).
 - a) ☐ All b) ☐ Some* c) ☐ None of the:
 1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

* Certified copies not received: _____.

5. ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. & 119(e).

Applicant has THREE MONTHS FROM THE "MAILING DATE" of this communication to file a reply complying with the requirements noted below. Failure to timely comply will result in ABANDONMENT of this application. **THIS THREE-MONTH PERIOD IS NOT EXTENDABLE**

6. ☐ Note the attached EXAMINER'S AMENDMENT or NOTICE OF INFORMAL APPLICATION (PTO-152) which gives reason(s) why the oath or declaration is deficient. A SUBSTITUTE OATH OR DECLARATION IS REQUIRED.
7. ☒ Applicant MUST submit NEW FORMAL DRAWINGS
 - (a) ☒ including changes required by the Notice of Draftsperson's Patent Drawing Review(PTO-948) attached
 - 1) ☐ hereto or 2) ☒ to Paper No. 04.
 - (b) ☐ including changes required by the proposed drawing correction filed _____, which has been approved by the examiner.
 - (c) ☐ including changes required by the attached Examiner's Amendment / Comment or in the Office action of Paper No. _____.

Identifying indicia such as the application number (see 37 CFR 1.84(c)) should be written on the drawings. The drawings should be filed as a separate paper with a transmittal letter addressed to the Official Draftsperson.

8. ☐ Note the attached Examiner's comment regarding REQUIREMENT FOR THE DEPOSIT OF BIOLOGICAL MATERIAL.

Any reply to this letter should include, in the upper right hand corner, the APPLICATION NUMBER (SERIES CODE / SERIAL NUMBER). If applicant has received a Notice of Allowance and Issue Fee Due, the ISSUE BATCH NUMBER and DATE of the NOTICE OF ALLOWANCE should also be included.

REQUEST FOR A CERTIFICATE OF CORRECTION OF PATENT

FOR APPLICANT'S MISTAKE (37 CFR 1.323)

Assistant Commissioner for Patents
Washington, D.C. 20231

Sir:

Certificate

SEP 13 2002

of Correction

In accordance with the provisions of 37 CFR 1.323 of the Rules of Practice, the Patent and Trademark Office is respectfully requested to issue a Certificate of Correction in the above-identified patent.

It is certified that errors appear in the above-identified patent as shown in the attached Certificate of Correction. Applicant certifies that the errors are of a minor character. Since the changes necessary to correct these errors in the patent would not constitute new matter, and would not require re-examination, a certificate of correction is requested.

Please pay the fee required by 37 C.F.R. § 1.20(a) \$100.00 to Deposit Account 13-4768. Charge any additional fees required by this paper or credit any overpayment in the manner authorized above.

A duplicate of this paper is attached.

Respectfully submitted,

Please forward all

09/198,095	11/23/1998	RODD B. ZURCHER	PD05929AP	2090

TITLE OF INVENTION: APPARATUS AND METHOD FOR HANDLING DISPATCHING MESSAGES FOR VARIOUS APPLICATIONS OF A COMMUNICATION DEVICE

TOTAL CLAIMS	APPLN. TYPE	SMALL ENTITY	ISSUE FEE	PUBLICATION FEE	TOTAL FEE(S) DUE	DATE DUE
11	nonprovisional	NO	\$1280	\$0	\$1280	06/11/2002

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. **PROSECUTION ON THE MERITS IS CLOSED.** THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN **THREE MONTHS** FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. **THIS STATUTORY PERIOD CANNOT BE EXTENDED.** SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE REFLECTS A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE APPLIED IN THIS APPLICATION. THE PTOL-85B (OR AN EQUIVALENT) MUST BE RETURNED WITHIN THIS PERIOD EVEN IF NO FEE IS DUE OR THE APPLICATION WILL BE REGARDED AS ABANDONED.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above. If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is changed, pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above and notify the United States Patent and Trademark Office of the change in status, or

B. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check the box below and enclose the PUBLICATION FEE and 1/2 the ISSUE FEE shown above.

☐ Applicant claims SMALL ENTITY status.
See 37 CFR 1.27.

II. PART B - FEE(S) TRANSMITTAL should be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). Even if the fee(s) have already been paid, Part B - Fee(s) Transmittal should be completed and returned. If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Box ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

AG

PART B - FEE(S) TRANSMITTAL

Complete and mail this form, together with applicable fee(s), to:

Box ISSUE FEE
Assistant Commissioner for Patents
Washington, D.C. 20231

MAILING INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 4 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Legibly mark-up with any corrections or use Block 1)

20280 7590 03/11/2002

MOTOROLA INC
600 NORTH US HIGHWAY 45
LIBERTYVILLE, IL 60048-5343

Note: The certificate of mailing below can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing.

Certificate of Mailing

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Box Issue Fee address above on the date indicated below.

1. Change of correspondence address or indication of "Fee Address" (37 CFR 1.563). Use of PTO form(s) and Customer Number are recommended, but not required.

- ☐ Change of correspondence address (or Change of Correspondence Address form PTO/SB/122) attached.
- ☐ "Fee Address" indication (or "Fee Address" Indication form PTO/SB/47) attached.

2. For printing on the patent front page, list (1) the names of up to 3 registered patent attorneys or agents OR, alternatively, (2) the name of a single firm (having as a member a registered attorney or agent) and the names of up to 2 registered patent attorneys or agents. If no name is listed, no name will be printed.

1 _____
2 _____
3 _____

3. ASSIGNEE NAME AND RESIDENCE DATA TO BE PRINTED ON THE PATENT (print or type)

PLEASE NOTE: Unless an assignee is identified below, no assignee data will appear on the patent. Inclusion of assignee data is only appropriate when an assignment has been previously submitted to the USPTO or is being submitted under separate cover. Completion of this form is NOT a substitute for filing an assignment.

(A) NAME OF ASSIGNEE

(B) RESIDENCE: (CITY and STATE OR COUNTRY)

Please check the appropriate assignee category or categories (will not be printed on the patent) ☐ individual ☐ corporation or other private group entity ☐ government

4a. The following fee(s) are enclosed:

- ☐ Issue Fee
- ☐ Publication Fee
- ☐ Advance Order - # of Copies _____

4b. Payment of Fee(s):

- ☐ A check in the amount of the fee(s) is enclosed.
- ☐ Payment by credit card. Form PTO-2038 is attached.
- ☐ The Commissioner is hereby authorized by charge the required fee(s), or credit any overpayment, to Deposit Account Number _____ (enclose an extra copy of this form).

The COMMISSIONER OF PATENTS AND TRADEMARKS is requested to apply the Issue Fee and Publication Fee (if any) or to re-apply any previously paid issue fee to the application identified above.

(Authorized Signature)

(Date)

NOTE: The Issue Fee and Publication Fee (if required) will not be accepted from anyone other than the applicant; a registered attorney or agent; or the assignee or other party in interest as shown by the records of the United States Patent and Trademark Office.

Burden Hour Statement: This form is estimated to take 0.2 hours to complete. Time will vary depending on the needs of the individual case. Any comments on the amount of time required to complete this form should be sent to the Chief Information Officer, United States Patent and Trademark Office, Washington, D.C. 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND FEES AND THIS FORM TO: Box Issue Fee, Assistant Commissioner for Patents, Washington, D.C. 20231

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

TRANSMIT THIS FORM WITH FEE(S)

CORRECTED FILING RECEIPT

OC000000007624532

Date Mailed: 03/12/2002

Receipt is acknowledged of this nonprovisional Patent Application. It will be considered in its order and you will be notified as to the results of the examination. Be sure to provide the U.S. APPLICATION NUMBER, FILING DATE, NAME OF APPLICANT, and TITLE OF INVENTION when inquiring about this application. Fees transmitted by check or draft are subject to collection. Please verify the accuracy of the data presented on this receipt. If an error is noted on this Filing Receipt, please write to the Office of Initial Patent Examination's Customer Service Center. Please provide a copy of this Filing Receipt with the changes noted thereon. If you received a "Notice to File Missing Parts" for this application, please submit any corrections to this Filing Receipt with your reply to the Notice. When the USPTO processes the reply to the Notice, the USPTO will generate another Filing Receipt incorporating the requested corrections (if appropriate).

Applicant(s)

DAVID F. BAUM, LAKE ZURICH, IL;
JAMES V. PEURSEM, HANOVER PARK, IL;

Domestic Priority data as claimed by applicant

Foreign Applications

If Required, Foreign Filing License Granted 12/15/1998

Projected Publication Date: Not Applicable, filed prior to November 29,2000

Non-Publication Request: No

Early Publication Request: No

Title

APPARATUS AND METHOD FOR HANDLING AND DISPATCHING MESSAGES FOR
VARIOUS APPLICATIONS OF A COMMUNICATION DEVICE

Preliminary Class

709

**LICENSE FOR FOREIGN FILING UNDER
Title 35, United States Code, Section 184
Title 37, Code of Federal Regulations, 5.11 & 5.15**

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Office of Export Administration, Department of Commerce (15 CFR 370.10 (j)); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

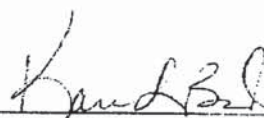

**BEFORE THE OFFICE OF ENROLLMENT AND DISCIPLINE
UNITED STATE PATENT AND TRADEMARK OFFICE**

LIMITED RECOGNITION UNDER 37 CFR § 10.9(b)

Hugh C. Dunlop is hereby given limited recognition under 37 CFR § 10.9(b) as an employee of Motorola, Inc. to prepare and prosecute patent applications wherein Motorola, Inc. is the assignee of record of the entire interest. This limited recognition shall expire on the date appearing below, or when whichever of the following events first occurs prior to the date appearing below: (i) Hugh C. Dunlop ceases to lawfully reside in the United States, (ii) Hugh C. Dunlop's employment with Motorola, Inc. ceases or is terminated, or (iii) Hugh C. Dunlop ceases to remain or reside in the United States on an L-1 visa.

This document constitutes proof of such recognition. The original of this document is on file in the Office of Enrollment and Discipline of the U.S. Patent and Trademark Office.

Expire: September 17, 1999

Karen L. Bovard, Director
Office of Enrollment and Discipline

(57) **ABSTRACT**

A communications device (10) with a processor having instructions that execute on the processor. The programmed instructions include a message manager program (16) for accepting and dispatching messages, one or more application programs (17, 18) for handling and presenting messages; and one or more message client programs (30, 40) that receive messages from the message manager program (16) and provides them to the application program. The message manager program (16) accepts a registration from each message client program and sets rules, and message attributes to which the rules are to be applied for new messages.

1

APPARATUS AND METHOD FOR HANDLING DISPATCHING MESSAGES FOR VARIOUS APPLICATIONS OF A COMMUNICATION DEVICE

FIELD OF THE INVENTION

This invention relates to a communications device comprising a processor having instructions that execute the processor in the form of interacting computer programs. The invention relates to such a device with a message manager program and a message client program.

BACKGROUND OF THE INVENTION

In the field of communication devices it has become desirable to make provision for more than one application program for enabling a user of the device to interact with incoming and outgoing messages. Such messages may be conveyed to and from the device over any of a number of bearer services or "transports", as described in U.S. Pat. No. 5,509,000 of Oberlander. Examples of such bearer services are: short messaging service in GSM "global system or mobile" digital cellular radio systems; universal datagram protocol "UDP" packets; and internet protocol "IP" packets.

When there are multiple bearers conveying messages to and from multiple user applications, at least two possible alternative architectures are available. In the first alternative, a universal mailbox is provided. All messages arrive at and are dispatched from the universal mailbox, regardless of the application that creates the message or accepts the message. This a complex arrangement from the point of view of facilitating application development, because careful consideration needs to be given to the interaction to the different applications and the competition of applications for handling of messages in the universal mailbox.

An alternative architecture provides that each application has its own mailbox. This is a more modular approach that is suitable for unlimited expansion by addition of new applications. A message manager is required between the applications and the various transports to manage the receipt and dispatch of messages between the various applications and the various transports.

It would be desirable to provide a message manager and an interface to one or more applications in an object-oriented programming language such as Java (TM), but currently such a language has no defined application programmer interface (API) adequate for such a function. It would be desirable to create an API that facilitates the handling and dispatching of messages between a message manager and various applications in a clear and a convenient manner to ensure the correct messages are delivered to the correct applications and to ensure that applications only receive messages that are of interest to those applications.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a block diagram of a communications device and its software structure.

FIG. 2 is a flow diagram illustrating an outbound message queuing process.

FIG. 3 is a flow diagram illustrating an inbound message routing process.

FIGS. 4 and 5 are flow diagrams illustrating processes performed by the message manager software of FIG. 1.

DETAILED DESCRIPTION OF THE DRAWINGS

Referring to FIG. 1, a communications device 10, such as a cellular telephone or a two-way mobile radio or a two-

2

pageing device e.g. a "Pagewriter"™ is shown, which comprises a microprocessor 11 coupled to a radio transceiver 12. The radio transceiver 12 will be referred to as the "physical" layer of the device, as it encompasses all physical functionality (such as channel selection, power control and time slot allocation or spreading or de-spreading), depending on the particular radio bearer that is being used by the communication device 10. The physical layer 12 communicates with the microprocessor 11 and with various software modules loaded into the microprocessor 11 and executing on that processor. It will be understood that the microprocessor 11 may also perform processes dedicated to the physical layer 12 but these need not be described in detail.

Within the microprocessor 11 there are various computer programs or software modules, including a transport program 15, a message manager program 16, and one or more applications. In the example shown, two applications are shown 17 and 18, labeled application "A" and application "B". Also shown is a message client 20 and a memory 22. FIG. 1 further illustrates a remote message store 25, which is not located within the communications device 10 but is in communication with the communications device 10. The remote message store 25 is shown as communicating with the message client 20, but this is shown for simplification. In fact the remote message store 25 uses the transport module 15 and the physical layer 12 to communicate with the message client 20 and also requires its own transport layer and physical layer (for example as described in U.S. Pat. No. 5,771,353 of Eggleston et al.) to establish this communication.

The applications A and B are programs that interact between a user of the communications device 10 and messages being received by and being received from the communications device 10.

In operation, the user interacts with these applications via any suitable user interface, typically a small screen and a keyboard or a screen and a pen and tablet interface. Examples of applications are an electronic mail application such as "Outlook" (TM) by Microsoft Corporation or "Lotus Notes" (TM), but there are many applications that may run on the processor 11 for handling and presenting messages and further examples are given below.

The operation will be described in broad outline and will again be described in greater detail. In broad outline, an outbound message is generated on one of the applications 17 and 18 and a message object is created and delivered to the message manager 16. The message manager 16 queues the message in an outbound message queue. The message manager 16 maintains a single queue or separate queue for each message type. The message manager 16 delivers the messages in a prioritized order to the transport program 15 which attempts to deliver the messages through the physical layer 12 to a destination (typically a server that is reached via radio base station). If the transport successfully delivers the message, it informs the message manager 16 that is ready to accept and deliver the next message. The particular ordering of the delivery of the messages by the message manager 16 to the transport layer 15 is unimportant. The ordering of messages may depend on what transport layer and what physical layer are available to the message manager, and further details can be found in copending patent application Ser. No. 08/720,984 of Pearce et al., filed on Oct. 15, 1996, now U.S. Pat. No. 5,910,951 and assigned to the assignee of the present invention, the specification of which is hereby incorporated by reference.

For inbound messages, the message manager 16 and the applications 17 and 18 require an orderly procedure for

determining whether the inbound message is to be delivered to one application or the other application or both applications. The software language used for construction of the message manager 16 and the applications 17 and 18 is preferably an object oriented language such as Java (TM). A class called MessageClient resides in the permanent instructions loaded in microprocessor 11. Upon receipt of a message, an instance 30 of the class is created for application A (this may be referred to as Message Client A). The message is delivered to Message Client A. Depending on the function of Message Client A, the message may be delivered to the application A. Alternatively, it may be delivered to memory 22 for later delivery to application A or they may be routed to remote storage 25. Similarly, the message is selectively delivered to Message Client B 40 and is delivered to application B. The selective delivery to Message Client A and Message Client B is described in greater detail below. The detailed description explains that the selective delivery of a message to one or both of the message clients 30 and 40 depends upon pre-registration of the respective message client with the message manager 16 and depends on attributes of messages for which the respective message client is registered with the message manager. It also depends on one or more rules in the message manager 16. The rule or rules in the message manager 16 is or are applied to attributes of each new message that arrives. Depending on the result of those rules, the message is delivered to one of those applications A or B or to both applications (and indeed any further applications that may exist).

For a more detailed description of the preferred embodiment of the invention, the following terminology will be used:

Client:—A Java application that may both source and sink Messages.

Message:—Data, and the addressing information necessary to deliver the data to another client, and optionally additional attributes.

Transport:—A session layer protocol that may send messages, or receive messages. Examples include SMS, SMTP, POP3 and IMAP4.

Inbound message:—Messages entering the devices via a transport.

Outbound message:—Messages created by a client and leaving the device via a transport.

Handled message:—A message that has had delivery attempted by a transport (outbound case) or a message that has been accepted and processed by a client (inbound case).

Unhandled message:—A message that has been refused a delivery attempt by a transport (outbound case) or a message that has been refused processing by a client (inbound case).

Four scenarios in particular are now described, including a message client 30 or 40 registering with the message manager 16, a message client queuing an outbound message for delivery, a message client participating in the routing of an inbound message and a transport creating an outbound message delivery session.

For a client to either queue an outbound message for delivery or be able to receive an inbound message, it must first register with the message manager 16. The process of registering with the message manager does not actually register the client itself, rather a specific implementation 30 or 40 of a subclass of the Message Client object 20 is registered. Thus, an implementation of a subclass of the message client object 20 is registered as "Message Client A". Following registration, the message manager 16 is able

to identify the name of the subclass implementation as "Message Client A" and for that subclass implementation, the message manager 16 maintains a record of the rules that are to be applied for that subclass and implementation upon receipt of a new message.

A message client provides two primary methods for the MessageManager:

SendComplete:—This method is called with a Message and a Status, and is used to inform a Client that a previously queued message has been sent.

Receive:—This method is used to give the Client an opportunity to accept a message. If after parsing the attributes or the body of the Message if the MessageClient decides it can process the Message it returns true, declaring the message handled. Otherwise the Client returns false declaring the Message not handled.

When a client registers a MessageClient with the MessageManager it also specifies what class of Messages it wants to be given a chance to accept. There are two classes: all, and unhandled only. MessageClients registered for all, will see every Message routed through the MessageManager, regardless whether another MessageClient has already handled the Message. MessageClients registered for unhandled will only be given an opportunity to accept messages that no other MessageClient has handled.

The message manager 16 maintains a table of message-Clients identified by name (Message Client A, Message Client B etc.) and of attributes of messages for which that Message Client is registered (handled/unhandled, type).

The process of queuing a message for outbound delivery is now described, with reference to FIG. 2. The process starts at step 100 and in step 101 a message object is created. A message object comprises a payload (for example text and/or graphics) and attributes such as subject, recipient, type and handled or unhandled. In step 102, the message type is set, the message manager 16 is called, that class being "MessageManager.QueueForSend". This class is called with the message and the message client class. The outbound message being processed ends at step 104.

The above simple process corresponds to the following pseudocode

```
Create a Message object
Set Message type
Set Message attributes
Set Message body
Call MessageManager.QueueForSend with the Message
and the MessageClient class.
```

MessageManager.QueueForSend will return a unique message ID that may be used by the client to remove the message from the outbound queue.

The Client will be notified by the MessageManager, via the MessageClient class, when a transport has attempted delivery of a queued message.

The message manager 16 does not actually trigger an outbound transport to run. It is the responsibility of the Client to actually trigger or direct a transport to run.

The process followed by a transport 15 to route an inbound message is somewhat similar and is illustrated in FIG. 3. Starting at step 200, a message object is created at step 201. In step 202 the message type is set the message attributes are set and the message body is set. In step 203 a class in the message manager is called, that class being "MessageManager.RouteMmessage". The process message performed by the transport is completed at step 204. The above described process is described by the following pseudocode:

5

Create a Message object
 Set Message type
 Set Message attributes
 Set Message body
 Call MessageManager.RouteMessage

Referring now to FIG. 4, a process or method performed by the message manager 16 following from step 204 is illustrated. This process starts at step 300. In step 301, the attribute or flag "handled" is set to "false", and this step simply indicates that this message has not yet been handled by any message client or any application. Then, a loop begins for each message client that is registered for all messages. This loop will be performed upon receipt of any message and it will be performed for any message client (on behalf of its associated application) that desires to receive all messages. In step 303, the class "MessageClient.Receive" is called with the message.

When MessageClient.Receive is called, that subclass instance (e.g. message client A) delivers a result. The result delivered is a simple "true" or "false". "True" is delivered when the respective message client indicates that it has handled the message. "False" is delivered when the respective subclass indicates when it has not handled the message. As will be explained below, it is entirely within the choice of the programmer as to whether the message client subclass instance delivers "true" or "false". Thereafter, the process determines whether the message has been indicated as having been handled by the respective message client. If the respective message client has delivered "true," step 305 determines that the message has been handled, and in step 306, the flag "handled" in the message manager 16 is set to "true" for that message. In either case, the process proceeds to step 307, where the message manager 16 determines if there is another message client that is registered for all messages. If there is another message client that is registered for all messages, the process returns to the beginning of the loop and a message client is created for the next application (e.g. message client 40). If following step 307, there are no messaging clients that are registered for all messages, the process ends at step 310 and flow can proceed to the process illustrated in FIG. 5.

The above RouteMessage method in the message manager 16 is detailed in the following pseudocode:

```

Set handled to False
For each MessageClient registered for all Messages
  Begin
    Call MessageClient.Receive with Message
    if Message handled then
      set handled to True
  End
  End
  
```

It may, incidentally, be noted that the process of FIG. 5 can be modified in the event that more than one type of message exists. Message types may include, SMS messages and internet messages. A message client may be registered for all SMS messages, or all internet messages, or all messages, whether SMS or internet. Thus, a message client may be registered for a first type of message or a second type of message or all messages. In such an example, step 307 can be modified to look for whether there is another message client that is registered for all messages for all message type. It may also be noted that a MessageClient can be created temporarily for the purpose of creating a call to that MessageClient and released immediately following the call.

Referring now to FIG. 5, a process is described that follows from the process of FIG. 4 and that is executed by

6

the message minder 16. This process begins at step 400 and is bypassed at step 401 via a bypass path 402 in the event that the message flag for the current message is set at "true". Thus, step 401 determines whether the message has been handled, and if the message has been handled, the process immediately ends at step 420. In other words, the process at FIG. 5 executes for unhandled messages only, and therefore only executes for message clients that are registered for unhandled messages only. In the event that there is an unhandled message, the processor proceeds to step 404. In step 405, the class MessageClient.Receive is called with the message. As before, the message client (e.g. message client B indicated by reference numeral 40 in FIG. 1) delivers either "true" or "false" to the message manager 16. Following step 405, step 407 determines whether the message has been handled. If the message has not been handled, step 408 determines whether there are any other message clients that are registered with the message manager for unhandled messages only. If there are, the process returns to step 404.

If, following step 407 the indicated as having been handled, the process proceeds to optional step 410. In this optional step, the "handled" flag is set to "true" for that message. The program will then proceed to step 420. Step 410 is indicated as optional, because the particular transport that called "route message" may not care whether the message is handled at all by any application or any message client. If the underlying transport needs to know that the message has been handled, then step 410 is necessary.

When there are no further message clients that are registered for unhandled messages or when the message has been handled by one of the message clients, the process ends at step 420.

The above described process is illustrated by the following pseudocode:

```

if not handled then
  Begin
    for each MessageClient registered for Unhandled
      Messages
      Begin
        Call MessageClient.Receive with Message
        if Message handled then
          end for loop
      End
    End
  End
  
```

There may be many message clients 30, 40, etc., that may be registered with the message manager 16. Message clients register in chronological order and the message manager 16 executes step 404 for the message clients in the chronological order in which they have registered. Thus, if applications A and B are both registered for unhandled messages only, message manager 16 will create subclass instance 30 first and if the instance of message client so created successfully handles a given message, message manager 16 will not create a message client instance 40 for application B, because flow will proceed from step 407 to step 420. The chronological order of registering of message clients with the message manager can be overridden such that the user or the program writer can devise a specific sequence in which message clients are to be created for a new message.

As before, a MessageClient can be created temporarily for the purpose of creating a call to that MessageClient and released immediately following the call.

It has been explained that the applications A and B may be electronic mail applications. Many other applications large and small can be devised with the structure described.

At a very minimum, there may be a message client created that has no corresponding application. At a very minimum this message client may have no function other than to deliver "true" for all messages. Such a trivial message client would simply consume all messages that arrive with no purpose. Or such a message client could, for example, simply count the incoming messages. Alternatively, it could count messages of a given type. For example it could count all fax messages and give an indication to the user that there are faxes that have arrived, so the user can turn to a connected fax machine to receive those messages. Another example of a simple message client would be a message client that extracts a sender's address and adds it to address book and it turns "false" to the message manager 16. Such a message client would build up an address book for all messages without interfering with operation of other applications interacting with the message manager 16. By returning "false" the message client would not interfere with the ability of other message clients to have the opportunity to receive the message. These are all examples of functions that can take place with the message client without necessarily invoking an application.

The message client can deliver a message to memory 22 or to remote storage 25 for later review when application A or application B is launched. Message client can return "true" if it wishes to indicate that it has successfully received the message and it wishes to prevent any other application from receiving that message or it can return "false" if it wishes to receive the message and simultaneously permit another application to receive the message.

It has been described how a message can have two attributes: a message type and a message handled flag. The message manager 16 applies rules to these attributes for each new message. There may, of course, be further attributes to which further rules can be applied, but adding more attributes and more rules adds complexity to the message manager 16 and it is preferred that such complexities are added to the message client 30. It is believed that the simple true/false delivery of the result by the message client and the provision of a few simple rules of the message manager provides sufficient flexibility for message clients to execute unlimited numbers of rules against a message and deliver true or false according to rules executed within the message client. As an example, a message client may only wish to handle messages during office hours and can return "false" at any time of day. This is an example of a rule that is executed in the message client. The possible rules and attributes executed by the message manager are illustrated in the following table. The table shows attributes as columns as rows.

	Handled	Unhandled	Don't Care
Type A		X	X
Type B		X	X
Don't Care		X	X

The table show six possibilities for rules that may be executed by the message manager. Conceivably a message manager could be devised to create a message client that is registered for handled messages only, but presently there is no apparent purpose for such a message client.

The computer programs illustrated in FIG. 4 and FIG. 5 in effect execute the rules illustrated in Table H, but will be appreciated by oneskilled in the art that there are many other ways of setting out the program that will create a message

client in a selected manner depending on attributes of a message or attributes held in the message manager 16 and deliverable in a software call to the message manager.

For completeness, operation of an outbound delivery session is now described. An outbound transport must iterate over all the messages (of a given type) in the MessageManager's queue. Just as in the inbound case the transport can inform the MessageManager of which messages it actually handled and which ones it didn't. It's entirely up to the transport to determine if it can actually handle (deliver) a message.

There is a distinct difference between attempting to deliver a message and failing; and not handling the message at all. Typically a Client will set a special attribute on all of the messages it queues. At a later time when the Client triggers the transport to run, it passes the special attribute to the transport. The transport uses this information to determine which messages it should handle and which messages it should not, by intervention over message and sending messages that match the "special attribute", as set out in the following pseudocode.

```

Call MessageManager.OpenTransportSession with a mes-
  sage type
Save the MessageContext returned
Call MessageManager.GetMessage with the Message-
  Context
While GetMessage returns a message

Begin
  If the transport can handle this message then
    Begin
      Send the message over the transport
      Call MessageManager.SendComplete,
        with the MessageContext, Message, and the send
        status
    End
  else
    Call MessageManager.ReturnUnHandledMessage,
      with the MessageContext and Message.
    Call MessageManager.GetMessage with MessageContext
  End
Call MessageManager.CloseTransportSession with
  the MessageContext

```

In summary, a communications device has been described comprising a processor having instructions that execute on the processor and it comprise: a message manager program 16 for accepting and dispatching messages; at least one application program 17, 18 for handling and presenting messages; and at least one message client program 30, 40, that receives messages from the message manager program and provides them to the application program. The message manager program accepts a registration from at least one message client program comprising at least one rule and at least one message attribute to which the rule is to be applied for new messages.

Similarly, a communications device has been described comprising a processor having first instructions 16 for message management, second instructions 17 or 18 for interacting between a message and the user; and third instructions 30, 40 for accepting a message from the first instructions and providing a message to the second instructions. The first instructions 16 accept a registration from at least one set of third instructions 30 or 40. The registration comprises at least one rule and at least on message attribute to which the rule is to be applied to new messages.

The above description has been given by way of example only, and modifications of detail can be made by one of

9

ordinary skill in the art without departing from the spirit and skill of the invention.

We claim:

1. A communication device including a processor having instructions that execute on the processor and that comprises:

- a message manager program for accepting and dispatching messages;
- at least one application program for handling and presenting messages; and
- at least one message client program, each message client program corresponding to a particular application program, that receives messages from the message manager program and provides them to the corresponding application program,

wherein the message manager program accepts a registration from each message client program including at least one rule and at least one attribute to which the rule is to be applied for new messages, and

wherein the at least one attribute including a handled/not handled attribute of messages, the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message.

2. The device according to claim 1, wherein the at least one message client program is created upon receipt of a new message and released following selective delivery of the message.

3. The device according to claim 1, wherein the message manager selectively delivers the new message to a message client program dependent on the handled/not handled attribute of the message.

4. The device according to claim 3, wherein the message manager creates the message client program dependent on the handled/not handled attribute of the message.

5. The device according to claim 1, wherein the message attribute includes a message type attribute.

6. The device according to claim 5, wherein the message manager selectively delivers the new message to a message client program dependent on the message type attribute of the message.

10

7. The device according to claim 6, wherein the message manager creates the message client program dependent on the message type attribute of the message.

8. The device according to claim 1, wherein the registration comprises at least first and second attributes including a handled/not handled attribute and a message type attribute.

9. The device according to claim 8, wherein the message manager program, upon receipt of a new message, executes first and second rules applied against the first and second attributes respectively.

10. The device according to claim 9, wherein the message manager selectively delivers the new message to a message client program dependent on a result of executing the first and second rules against the first and second attributes.

11. A communication device including a processor having instructions that execute on the processor and that comprises:

a set of first instructions for message management;

at least one set of second instructions for interacting between message and a user; and

at least one set of third instructions, each set of third instructions corresponding to a particular set of second instructions, for accepting a message from the first instructions and providing the message to the corresponding set of second instructions, wherein

the first instructions accept a registration from each set of third instructions, the registration including at least one rule and at least one attribute to which the rule is to be applied for new messages, the at least one attribute including a handled/not handled attribute of messages, and the handled attribute indicates that a transport has attempted deliver of a particular message or a client has processed the particular message whereas the not handled attribute indicates that the transport has refused delivery of the message or a client has refused processing of the message.
