IN THE UNITED STATES DISTRICT COURT
DISTRICT OF UTAH
CENTRAL DIVISION

NOVELL, INC.,)
Plaintiff,)
vs.) CASE NO. 2:04-CV-1045 JFM
MICROSOFT CORPORATION,)
Defendant.)
_____)

BEFORE THE HONORABLE J. FREDERICK MOTZ

November 9, 2011

Jury Trial

A P P E A R A N C E S

1
2
3 For Plaintiff:

PAUL TASKIER
JEFFREY JOHNSON
MIRIAM VISHIO
1825 Eye Street, N.W.
Washington, D.C.

6 JOHN SCHMIDTLEIN
7 725 Twelfth Street, N.W.
Washington, D.C.

8 MAX WHEELER
9 10 Exchange Place
11th Floor
Salt Lake City, Utah

10
11 For Defendant:

DAVID TULCHIN
STEVEN HOLLEY
SHARON NELLES
125 Broad Street
New York, New York

14 STEVE AESCHBACHER
15 One Microsoft Way
Redmond, Washington

16 JAMES JARDINE
17 36 South State Street
Suite 140
Salt Lake City, Utah

Exhibit	Received
(No exhibits received.)	

1 November 9, 2011

8:00 a.m.

2 P R O C E E D I N G S

3
4 THE COURT: Good morning, everyone.

5 Be seated or keep standing. You have to stand for
6 the jury anyway.

7 (WHEREUPON, the jury enters the proceedings.)

8 THE COURT: Good morning, everybody. I really
9 like your promptness and diligence.

10 Mr. Schmidtlein.

11 MR. SCHMIDTLEIN: Thank you, Your Honor.

12 Your Honor, the plaintiff calls Mr. Ronald Alepin.

13 THE COURT: Mr. Alepin.

14 RONALD SALEM ALEPIN

15 Having been duly sworn, was examined

16 and testified as follows:

17 THE COURT: If you feel uncomfortable at some
18 time, just let us know and we'll try to --

19 THE WITNESS: Thank you very much. I expect to
20 take you up on that.

21 THE COURT: Anything that we can do --

22 THE WITNESS: My full name is Ronald Salem Alepin,
23 R-o-n-a-l-d, S-a-l-e-m, A-l-e-p-i-n.

24 DIRECT EXAMINATION

25 BY MR. SCHMIDTLEIN

1 Q. Good morning, Mr. Alepin.

2 A. Good morning.

3 MR. SCHMIDTLEIN: As you just indicated, Mr.
4 Alepin has unfortunately recently had a problem with his
5 tendon in his shoulder, and we may ask for a break
6 periodically.

7 THE COURT: Absolutely.

8 MR. SCHMIDTLEIN: He gets some shooting pain, and
9 don't be alarmed, and hopefully not in my questioning, but
10 he has been very good and has postponed some surgery which
11 would have made him unavailable for us, so we're going to
12 move ahead as best we can here today.

13 BY MR. SCHMIDTLEIN

14 Q. Mr. Alepin, where do you currently work?

15 A. In Silicon Valley.

16 Q. And who do you work for?

17 A. I have my own company, a consultant company.

18 Q. What is the name of the company?

19 A. Los Altos Systems Research.

20 Q. Have you been retained by Novell in this case as an
21 expert witness?

22 A. Yes.

23 Q. What have you done in connection with your work, your
24 assignment as an expert? What types of materials have you
25 reviewed in this case?

1 A. A large amount of stuff. I looked at computer
2 programs, documentation and I operated computer programs and
3 examined their results. I read countless pages of material
4 from the trade press and also from third-party books written
5 about the software programs in question, as well as reading
6 and studying the deposition testimony from witnesses in the
7 case, and the documents that were produced including
8 e-mails, reports, presentations, also produced by both
9 companies in this case.

10 Q. Are you familiar with and have you at least reviewed
11 the expert reports that were submitted by Microsoft's
12 experts in this case?

13 A. Yes.

14 Q. When were you first contacted about becoming an expert
15 witness?

16 A. I believe it was in the spring or early summer of 2008,
17 as memory serves.

18 Q. And as a part of your consulting work, do you charge
19 your clients for the time that you spend doing consulting
20 work?

21 A. I do.

22 Q. What is your hourly rate?

23 A. My hourly rate is \$400 an hour.

24 Q. And is that the rate that you charged in connection
25 with this matter?

1 A. Yes.

2 Q. And just ballpark, roughly how many hours have you
3 spent in connection with this retention in terms of the time
4 you have spent formulating and coming to some of your
5 opinions and producing the expert reports that you were
6 obliged to produce in this case?

7 A. To the present time?

8 Q. Well, to the time that you were formulating your
9 opinions and providing your expert reports and were deposed
10 in connection with the discovery process?

11 A. I understand. About 1,200 hours, I think, around
12 there.

13 Q. Based on the work that you have done in this matter,
14 are you prepared to offer opinions based on your expertise?

15 A. I am.

16 Q. Let me talk a little bit about your education and your
17 professional background first, if I may.

18 MR. SCHMIDTLEIN: Your Honor, we have marked as
19 Exhibit 575 Mr. Alepin's resume.

20 May I approach?

21 THE COURT: Of course.

22 BY MR. SCHMIDTLEIN

23 Q. Mr. Alepin, can you identify Exhibit 575 for the
24 record?

25 A. This is a copy of my curriculum vitae.

1 Q. Let's sort of go back to the beginning here starting
2 with your education.

3 Did you attend college?

4 A. I did.

5 Q. Where did you go to college?

6 A. I went to McGill University.

7 Q. Where is McGill University?

8 A. McGill is in Montreal, Quebec Canada.

9 Q. What did you study at McGill?

10 A. I studied economics, econometrics and computer science.

11 Q. When were you enrolled at McGill University?

12 A. From 1967 up 'til approximately 1971.

13 Q. And while you were there, aside from some of your
14 studies in computer science, did you do any other computer
15 or software related activities?

16 A. Yes.

17 Q. Can you describe those, please.

18 A. Well, I did work for the social sciences statistical
19 laboratory, which was a facility that the departments of
20 anthropology and sociology, political science and economics
21 had put together to provide access to McGill University's
22 computing facility, and allowed the professors there and
23 selected students to conduct research using computer
24 systems. I made myself available to the professors using
25 the laboratory to develop programs to assist them in their

1 analysis.

2 Q. Is it fair to say that while you were in college that
3 you wrote software programs for some of the social science
4 departments at McGill?

5 A. That is correct.

6 Q. And were there particular projects that you worked on
7 there?

8 A. Yes. Some of them included -- I developed a program to
9 perform cost-benefit analysis modeling for the World Bank to
10 allow them to determine the value of constructing a road in
11 Mali, which is a country in Africa.

12 I wrote another program that provided -- this was in
13 conjunction with the medical school, but it provided the
14 ability to model the flow of blood cells, white and red
15 blood cells through veins in peoples bodies in order to
16 track how you could deliver certain types of medicine.

17 I wrote another program that was based on some research
18 in 1900 biology that applied some of their statistical
19 methods to estimating statistical values on data that had
20 lots of missing values. And so oftentimes times people
21 couldn't perform an analysis reliably if you were missing a
22 couple of years of information, which in this case it was
23 from Africa in particular. So using the methodology I was
24 able to allow them to proceed even though they were missing
25 or they had dirty data.

1 Q. Now, did you obtain a degree from McGill University?

2 A. No, I did not.

3 Q. Why not?

4 A. I -- increasingly the call of playing with computers
5 was driving me to want to be out in the world and to be
6 playing with computers. It was a moment in time where
7 people were paying me lots of money to essentially do what I
8 found to be very exciting. In my last year at the
9 university, in fact, a company paid me my tuition if I would
10 go to work for them, so I found it too irresistible to
11 continue studying economics rather than programming
12 computers.

13 Q. At this point in time were there sort of large
14 sophisticated computer science departments at universities?

15 A. They were large only because the only computers then
16 that computer science departments had were large computers,
17 large mainframe computers, but computer science was really
18 starting up. There were not a whole lot of disciplines in
19 there, and there wasn't a whole lot of structured teaching
20 along those lines, so a lot of it had to do with mathematics
21 and probabilities and that kind of stuff.

22 Q. During this time period was it unusual for people who
23 were interested in computer programming to pursue their
24 interests in computer science without getting a degree?

25 A. I think that is true, yes.

1 Q. Can you give some examples of some people --

2 A. Oh, this is -- these people are much more famous
3 than --

4 THE COURT: Ask him to give one.

5 BY MR. SCHMIDTLEIN

6 Q. One or two.

7 A. Bill Gates, Steve Jobs.

8 Q. Now, you made reference to a company that had
9 approached you and you had begun doing work for while you
10 were at McGill.

11 What company was that?

12 A. That was Bell Canada. They were the Canadian
13 equivalent of AT&T a long time ago when AT&T had all of the
14 baby bells around the country organized inside of it.

15 Q. And what were you hired to do at Bell Canada?

16 A. Basically I was hired to be I guess a programmer at
17 Bell Canada. It was more come join us, we have one computer
18 of every kind on the floor, and you find what you like to do
19 and we'll see if we can make it happen.

20 Q. Can you tell the jury, did you develop any software
21 while you were working at Bell Canada?

22 A. I did.

23 Q. And did you write code?

24 A. I did.

25 Q. Can you describe a little bit about some of the

1 software programs and the code that you wrote? Describe
2 that for the jury.

3 A. I wrote in these days, still the early days of
4 computing, so there is not -- there are not a lot of
5 packages of software that assist the systems programming
6 people in doing their jobs. The systems programming people
7 are the people who look after the operating system and look
8 after the hardware and put on new software.

9 They come calling, come running when the computer stops
10 and they try and finger out why the computer stopped, and so
11 I wrote lots of software that facilitated the application of
12 new releases of software programs that facilitated the
13 analysis of computer failures, that allowed the systems
14 programming and I.T. management teams to access the
15 computers from terminals. So it was called C.R.B.E.,
16 conversational remote back entry, software that would allow
17 you to access the computer without having to run downstairs
18 into the machine room.

19 Q. Now, how long did you work at Bell Canada, to the best
20 of your memory?

21 A. About two and a half years.

22 Q. You worked there roughly between 1971 and 1973; is that
23 right?

24 A. I think it says '74 here.

25 Q. Okay. Where did you go to work next?

1 THE COURT: Would you like a page turner there to
2 help you turn --

3 THE WITNESS: No. There are only a few pages.
4 Thank you. Later on that may be -- I went to work for a
5 company called Societe de Mathematiques Appliquees.

6 BY MR. SCHMIDTLEIN

7 Q. Which is French, I take it?

8 A. It is actually a French way of saying Applied
9 Mathematics Corporation.

10 Q. Where were they located?

11 A. They were also located in Montreal, in Canada.

12 Q. What did you do there?

13 A. I was the software developer at that company.

14 Q. What were you developing software for at -- I am just
15 going to refer to it as SMA, if that is okay.

16 A. I'm sorry. The question?

17 Q. What types of software were you developing?

18 A. I was developing software to optimize the computer
19 systems for use in a service bureau environment.

20 Q. Describe what a service bureau is for the jury, please.

21 A. Well, in those days, and this is the early seventies
22 and the years preceding that and actually afterwards,
23 mainframe computers cost a lot of money. The cost a lot of
24 money not just to acquire but to operate. You needed to
25 have a special room with special cooling and a raised floor

1 and special electricity, and you needed special people to
2 operate the computer. That cost a lot of money and not
3 everybody could -- not all companies and all organizations
4 could afford that kind of a computer system, but they wanted
5 to take advantage of some of the features that they could
6 get with a computer. They could get their payroll done
7 faster, get their planning done more quickly, so they would
8 come to companies that were organized as service bureaus and
9 the service bureau would do their work for them.

10 You can imagine they would come up to the window with a
11 deck of punched cards, and they would give it to the
12 operator and the operator would take those cards and read
13 them into their computer, and at some appropriate time their
14 job would run and the results would be returned to them.
15 That is the basic concept behind a service bureau. They
16 don't operate the computer. The service bureau operates the
17 computer and we run their work for them.

18 Q. After you worked at SMA, where did you go to work next?

19 A. I went to work at L'Industrielle Services Techniques,
20 which is another way of saying Industrial Technical
21 Services, Inc.

22 Q. Where were they located?

23 A. Montreal.

24 Q. Describe for me your job responsibilities there.

25 A. I was the lead software developer up to their director

1 of software development during my tenure there. IST was a
2 service bureau like Applied Mathematics was a service
3 bureau, and my job was developing software for IBM's newest
4 main frame computer system and its newest operating system.

5 Q. How long did you work there?

6 A. Two and a half years, approximately. Something like
7 that.

8 Q. Did you next go to work for a company called Amdahl?

9 A. Yes, I did.

10 Q. And what was Amdahl?

11 A. Amdahl was a company that developed what came to be
12 known as plug compatible IBM mainframe computers.

13 Q. Where were they located?

14 A. In Sunnyvale, California, in Silicon Valley.

15 Q. What types of software -- or tell me what your job
16 responsibilities were there.

17 A. I came to work there in software development, and I was
18 part of an advanced team inside Amdahl that was thinking
19 about software that needed to be developed to make Amdahl's
20 products more superior to IBM's products.

21 Q. Are you familiar with the term benchmarking?

22 A. I am.

23 Q. Were you involved in job responsibilities relating to
24 benchmarking at Amdahl?

25 A. I was. I became -- I was asked to take on the

1 responsibility of managing the benchmark and performance
2 analysis center at Amdahl.

3 Q. Explain your use of the term benchmark in that context
4 for the jury.

5 A. Well, buying a mainframe computer, and this is the late
6 1970s, was still extensive, a very expensive proposition,
7 and people wanted to make sure that if they bought a non-IBM
8 computer that was being sold as capable of running their IBM
9 computer programs, that it could run their IBM computer
10 programs, because maybe their programs were special.

11 I know you can run somebody else's program, but maybe
12 they can't run my programs, or maybe they can run them but
13 maybe that can't run them as fast as IBM can run their
14 programs. So they wanted to kick the tires with their
15 programs. They would come to our facility, which I was
16 responsible for, and we put in multiple large mainframe
17 computers from Amdahl and lots and lots of disks and lots of
18 tape drives with spinning wheels and other equipment, and we
19 would take their programs and demonstrate that they worked,
20 and that they in fact worked faster on our computer system
21 than on IBM's.

22 Of course, the customer would go to IBM in
23 Gaithersburg, Maryland, and they would see what the results
24 were that they got on their computers and usually we won.
25 Usually we won.

1 Q. And did you write lots of operating system software
2 while you were at Amdahl?

3 A. I did.

4 Q. And I think, as you said, was a fair amount of the work
5 that you did at Amdahl relating to software compatibility
6 issues?

7 A. There was a good deal of it that related to
8 compatibility, yes.

9 Q. Now, after you left Amdahl what did you do next? Is
10 that when you started your consulting firm?

11 A. That is correct.

12 Q. And where is your consulting firm based?

13 A. In Los Altos, Silicon Valley.

14 Q. Can you give some examples of the types of companies
15 that have hired you as a consultant?

16 A. Let's see. Starting back in the early eighties, Boole
17 & Babbage, which was a software company, an independent
18 software vendor, an ISV, and they were in the business of
19 writing software that extended the operating system or
20 provided tools for the operating system. I wrote software
21 for them as well as software that took them into a different
22 market, software that helped programmers develop programs,
23 so like developer's toolkit kinds of programs.

24 At Systems Industries they developed hardware and
25 software for digital equipment, DEC computers, Vax computers

1 sometime it is called. I worked for Care. Care was a
2 company that developed the software and the hardware that
3 reads the two lines of information on your passport that are
4 encoded in OCR. That was a breakthrough. Before readers
5 could only read one line. It is hard to imagine now that
6 that was a breakthrough, but it was. They also developed
7 page reading and optical character recognition software, so
8 that you could scan a page and read it and have the page
9 converted into real words that you could work with.

10 I worked with IBM and with Roam. Roam was a telephone
11 switch company. They made PBXs for offices.

12 Q. Are you familiar with a company called Controlled Data
13 Corporation?

14 A. Yes, I am. Thank you.

15 Controlled Data Corporation a long time ago was one of
16 the largest computer companies in the world and made the
17 largest computer in the world, the CDC-7600. It had a line
18 of business called the Service Bureau Corporation, which was
19 a company that they had acquired from IBM, but basically it
20 was a service bureau with offices around the United States.
21 They operated a service bureau, and they hired me for a
22 variety of software development tasks inside the service
23 bureau subsidiary.

24 Q. In connection with your work with Controlled Data, were
25 you involved in the development of business application

1 software?

2 A. Yes.

3 Q. Can you describe that for us?

4 A. Well, CDC was interested in the early 1980s, at the
5 dawn of the PC revolution, they were interested in branching
6 out and having some software that worked on computer systems
7 like Wang systems where you would have typewriter -- word
8 processing applications, and they also were interested in
9 getting into PCs, seeing whether it would be good business
10 for them to tie to PCs.

11 In that regard they asked me to look at a company and a
12 product called VisiOn that was available and was being sold.
13 The company was selling their product, the whole product,
14 and CDC asked me if I would look at this Visi On product.
15 It is spelled V-i-s-i O-n. The owning company at the time
16 was VisiCorp, which was the company that was responsible for
17 VisiCalc. If you go back in time you will remember the
18 original program that made personal computers interesting
19 was VisiCalc's spreadsheet on a little Apple 2 computer.

20 They had developed this Visi On program and they were
21 offering it for sale, and I did an evaluation of the product
22 and an evaluation of the team and an evaluation of the
23 software. At the time it was remarkably advanced. It
24 allowed you to do -- this is 1983 -- it allowed you to do
25 what you see is what you get word processing and what you

1 see is what you get -- excuse me -- spreadsheets.

2 That means that as you typed you saw your words as they
3 would appear on the page. At the time people were using
4 word processors that allowed you to enter the words and you
5 would put maybe some formatted codes in the document, and
6 you would see perhaps the formatting codes, but it wouldn't
7 show you what the document was ultimately going to look like
8 when it printed out. The breakthrough with Visi On was that
9 you could see it on the screen as you typed, and you could
10 have the two of them together. You could have the document
11 and the spreadsheet open at the same time and you could be
12 operating them simultaneously. It was quite remarkable.

13 Q. Is it fair to say that you have done consulting work
14 for dozens and dozens of companies?

15 A. That is correct, yes.

16 Q. And have you done consulting work for companies like
17 Yahoo and Oracle?

18 A. Yes.

19 Q. I want to talk a little bit about one company in
20 particular. Is there one company in particular that you
21 have done sort of more significant or substantial consulting
22 work than others?

23 A. Yes.

24 Q. What company was that?

25 A. Fujitsu, F-u-j-i-t-s-u.

1 Q. Tell the jury, what is Fujitsu?

2 A. At the time that I began my relationship with Fujitsu
3 they were I think the third largest computer company in the
4 world. They became the second largest computer company in
5 the world and now they are maybe the sixth largest. Most of
6 their business is outside of the United States. A lot of it
7 or the majority of it is in Japan.

8 Q. Can you describe -- I think you have held a number of
9 different positions and performed a number of different sort
10 of functions for Fujitsu. When you were first hired by
11 Fujitsu, can you describe sort of the project that you were
12 hired to work?

13 A. We're talking about 1985 or thereabouts?

14 Fujitsu -- I had mentioned that Fujitsu was a large
15 computer company, and Fujitsu was a company that made
16 basically anything in electronics and IT that you could plug
17 in. So if it used electricity, they made it. They also
18 developed large mainframe computers, and mainframe computers
19 that were substantially compatible with IBM mainframe
20 computers at the time. They had a business relationship
21 with IBM, and there was a dispute in the business
22 relationship between the two companies that involved
23 operating systems software, and Fujitsu asked me to come and
24 help them with this dispute.

25 Q. And how long did that dispute play out?

1 A. Ten years. It was a long dispute.

2 Q. Just at a high level, were you involved and as part of
3 your work on that did you review software code?

4 A. Yes, I did. Fujitsu came to me in part because -- not
5 in part, they came to me because they were of the opinion
6 that the only people who could understand the issues and
7 could understand the software in their operating systems and
8 in IBM's operating systems and could provide advice and
9 analysis on that either worked for Fujitsu or worked for
10 IBM, and they were not going to hire somebody from IBM, and
11 somebody from Fujitsu was not going to be much help in
12 providing an independent voice on this.

13 So they came to me as someone who was outside of IBM
14 and Fujitsu and was capable of understanding the intricacies
15 of the operating systems. My job became one of analyzing
16 the operating system software from IBM and comparing it with
17 the operating system software from Fujitsu, and trying to
18 determine whether there were any similarities between the
19 two systems that were not the result of proper operating
20 system design, or part of writing an operating system for a
21 large mainframe computer, or writing an operating system
22 that was concerned about robustness or high performance,
23 because if there were some similarities that were not
24 explainable by that, then Fujitsu might need a license for
25 that stuff if they had obtained it from IBM.

1 So that was my job. There were maybe 20 million lines
2 of code, something like that, across maybe 20, 24 programs,
3 something like that.

4 Q. At the conclusion of this sort of dispute, this legal
5 dispute between IBM and Fujitsu, did Fujitsu continue to
6 employ your services in other capacities?

7 A. I think I should have -- once the dispute was
8 concluded, and that didn't take ten years, that took only a
9 couple years. The next set of years, probably eight years,
10 was spent identifying programming interfaces that would be
11 necessary to allow Fujitsu to develop an operating system
12 that would be compatible with IBM's operating system.

13 So the idea here is, and this was for money, and we had
14 arranged a payment system, but the net result was that we
15 were going to identify a set of APIs, and it was broader
16 than APIs, communications protocols, message formats,
17 programming languages, command syntaxes, everything that was
18 part of the interface of a program, of an operating system,
19 and what of those were necessary to allow for compatibility
20 and interoperability between the operating systems so that a
21 customer could take a program, or take his knowledge and go
22 from an IBM computer to a Fujitsu computer and not suffer
23 much in the way of conversion. For that it took about eight
24 years.

25 We processed more than a quarter million pages of

1 documentation, looking at the documentation and saying is
2 this part of the interface of this program? Should this be
3 available? Is it necessary for interoperability? Is it
4 necessary for compatibility? If it was, we put it in this
5 stack. If it wasn't, we let it go. That is what we did for
6 eight years after the two years of dispute resolution.

7 Q. Did there come a time when Fujitsu engaged you to be a
8 chief technology officer and vice president?

9 A. Yes.

10 Q. Can you explain generally what your job
11 responsibilities were in that context?

12 A. Well, I became a resource for the various divisions
13 within Fujitsu in Japan to assist them in developing
14 technology strategies and partnerships with companies, with
15 technology companies in the United States and Europe. For
16 example, Fujitsu had entered into a partnership with Nokia,
17 which now makes cell phones. Back then they made telephones
18 too, but they had a groupware product called TeamWare, and
19 TeamWare was I think the largest selling groupware product
20 in Europe by seats. People counted it by how many users do
21 you have, which was the way that people kept score in the
22 groupware business.

23 Fujitsu was interested in expanding groupware's market
24 into the United States, so I worked with them and with AT&T
25 to try and get TeamWare through AT&T into North America.

1 I worked with Fujitsu in evaluating part of the network
2 computer project which was in 1996 or thereabouts, 1997.
3 Some companies, Intel, IBM, Lotus, a subsidiary of IBM, were
4 interested in seeing whether there was an alternative to the
5 PC that was based on Java, which was a technology that maybe
6 has been discussed here, but that wouldn't run Windows. It
7 would run something else. It would run Java. So I was part
8 of the team from Fujitsu who was evaluating the viability of
9 that technology and looking at whether Lotus's software,
10 personal information manager, its word processor and
11 spreadsheet processor that it had put on the network
12 computer were competitive with what was being offered by
13 companies like WordPerfect and Microsoft on PCs. It was
14 just an attractive option, and should we go and invest
15 money, because Fujitsu could have made the computer itself,
16 because it was in the computer manufacturing business as
17 well. There was an opportunity there.

18 Q. In addition to the business consulting project, the
19 examples of the business project consulting jobs that you
20 have done, have you also done consulting in connection with
21 litigation?

22 A. Yes, I have.

23 Q. Have you been retained in the past by, for example, the
24 United States Department of Justice?

25 A. Yes, I have.

1 Q. Have you been retained by private companies to provide
2 consulting services in connection with litigation?

3 A. Yes.

4 Q. Have you been retained in any other matters that
5 required you to look at and analyze products manufactured by
6 Microsoft?

7 A. Yes.

8 Q. Have you been retained by state attorneys general in
9 connection with legal proceedings involving Microsoft?

10 A. Yes.

11 Q. During the course of those engagements, have you had an
12 opportunity to review and analyze various Microsoft
13 products?

14 A. Yes.

15 Q. Can you describe some of the products that you have
16 looked at in connection with some of your litigation
17 consulting?

18 A. I have looked at MS DOS, Microsoft's DOS operating
19 system. I have looked at various versions of Microsoft
20 Windows, from Windows 2.03, I think. I have looked at
21 Windows 95, Windows 98 and versions following that. I have
22 looked at specific technologies, the Windows Media Player,
23 the Internet Explorer, and I have looked at Microsoft's
24 server based operating systems and the communications
25 protocols within the server computers.

1 I have looked at Microsoft's word processing software
2 and office products software more generally.

3 Q. Have you participated in any proceedings before
4 European competition authorities?

5 A. Yes.

6 Q. How many proceedings over there have you participated
7 in?

8 A. Do you mean separate matters or times?

9 Q. Separate -- well, how many appearances have you made?

10 A. Dozens. Dozens.

11 Q. Can you give me an example of some of the types of
12 clients, private companies who have retained you to provide
13 consulting services in matters involving Microsoft?

14 A. Are you referring to Europe now, European --

15 Q. Europe. Aside from the present case, in Europe or in
16 other places what types of companies have retained you?

17 A. What type of companies? Do you mean by name?

18 Q. Yes.

19 A. Okay. Real Networks, and they are the company that
20 made the original media player, IBM, Oracle, Sun, some trade
21 associations, the Computer Information Industry Association,
22 the software industry -- SIIA, Software and Information
23 Industry Association, ECIS, the European Community for
24 Interoperable Systems, and I think that is probably the
25 list.

1 Q. In your career can you estimate how many software
2 programs that you have developed or modified?

3 A. Hundreds. Hundreds.

4 Q. How many lines of coded that you have written?

5 A. Many hundreds of thousands of lines of code. Many
6 hundreds of thousands, maybe millions of lines of code, yes.

7 Q. Can you even estimate how many lines of code that you
8 have reviewed and analyzed in the course of your career?

9 A. Tens of millions of lines of code.

10 MR. SCHMIDTLEIN: Your Honor, at this time we ask
11 that Mr. Alepin be qualified as an expert generally in
12 computer software development and computer system design.

13 THE COURT: Yes.

14 MR. HOLLEY: May I voir dire, Your Honor?

15 THE COURT: Of course.

16 VOIR DIRE EXAMINATION

17 BY MR. HOLLEY

18 Q. Good morning, Mr. Alepin. Nice to see you again.

19 Now, you told Mr. Schmidtlein that you don't have a
20 college degree; is that right?

21 A. That is correct.

22 Q. And you were not suggesting, were you, sir, that at the
23 time you went to college there were not computer science

24 department in universities? You were not saying that, were
25 you?

1 A. No, I was not.

2 Q. Because when you went to college the Massachusetts
3 Institute of Technology, the Georgia Institute of
4 Technology, and Carnegie Mellon University and Stanford
5 University, they all had computer science departments,
6 right?

7 A. And McGill University had a computer science department
8 as well. A good one, actually.

9 Q. Now, you have never taught a course in computer science
10 at any college or any university; isn't that right?

11 A. That is correct.

12 Q. Have you ever written a book about computer science?

13 A. No.

14 Q. You have never written any articles in any scholarly
15 journal about political -- about computer science; is that
16 right? Or political science either, but about computer
17 science?

18 A. No, I have not.

19 Q. Okay. None of the work that you have ever done in the
20 field of computer science has been peer reviewed by people
21 who are professors of computer science; isn't that right?

22 A. I think that is correct.

23 Q. And you have never done any basic research in the field
24 of computer science?

25 A. If by that you mean associated with a university, no.

1 Q. Okay. Now, when I asked you at your deposition in this
2 case, in August of 2009, whether you were an expert in the
3 design and development of PC operating systems, you declined
4 to answer that question.

5 Isn't that right, sir?

6 A. I am not sure that the exchange went that way. I
7 remember the conclusion that you stated for the record at
8 the time, yes.

9 Q. Well, isn't it true, Mr. Alepin, that when I asked you
10 the question are you an expert in the design and development
11 of PC operating systems, that your answer was that is a
12 difficult question to answer? You didn't say yes, did you,
13 sir?

14 A. I gave examples of where I would consider myself to be
15 an expert.

16 Q. But not in the design or development of PC operating
17 systems. That question you declined to answer yes, isn't
18 that fair?

19 A. I don't think that that is fair, no.

20 Q. Well, I'm happy to show you your testimony if that
21 would be helpful.

22 A. I remember it quite well.

23 Q. Okay. When I asked you do you know of all of the
24 considerations that go into designing and developing a PC
25 operating system you said no; isn't that right?

1 A. That is -- I don't believe that that is exactly the way
2 the conversation went.

3 Q. Well, I'm happy to read this to you, and if you want to
4 see the transcript that is fine, but do you recall being
5 asked the question do you believe --

6 THE COURT: Mr. Schmidlein needs a page and line.

7 MR. HOLLEY: It is page 24, lines 3 through 18,
8 Your Honor.

9 BY MR. HOLLEY

10 Q. Do you recall being asked the question, do you believe
11 that you are an expert in the design of personal computer
12 operating systems? Answer, that is a difficult question to
13 answer. Do I think I could design a personal computer
14 operating system? The answer is yes. Do I have an
15 understanding of the subject matter? Yes. Do I understand
16 the considerations? Not all of them, but I believe I could
17 design a personal computer operating system. Could I
18 compare a personal computer operating system to operating
19 systems from servers and mainframe computers, for example,
20 and identify the significant differences? Yes, I think I
21 can do that. So I am not sure I can take your question on.

22 Do you recall that, sir?

23 A. That is correct, yes.

24 Q. You did say that you didn't understand all of the
25 considerations that went into designing and developing PC

1 operating systems?

2 A. I think that that -- I was trying to get the frame of
3 reference that you understood by what an expert for a PC
4 operating system was, and I was offering you examples of
5 where I would have expertise in the area, and there may be
6 particular points within a subject that I would not have
7 specific knowledge of, but I was answering your question if
8 you understand comparing operating systems, relative
9 features, yes, I can do that. Yes, I'm an expert in that,
10 if you understand it by whether you are able to build -- if
11 the expertise is deemed are you able to build one then, yes,
12 I am an expert in it.

13 If it is that you understand each and every one that
14 goes into a particular operating system, then maybe I don't
15 have all of the individual elements of a particular
16 operating system in my head.

17 Q. You have never worked on the development or design of
18 any PC operating system. Isn't that fair, sir?

19 A. I have worked with the designs of personal computer
20 operating systems, yes.

21 Q. Mr. Alepin, you recall being deposed in 2003, don't
22 you, in a case involving Microsoft? Do you recall being
23 asked this question?

24 MR. HOLLEY: Sorry. This is the MDL deposition,
25 page 32, line 18, to page 33, line 2.

1 THE COURT: I am just curious, is this the
2 consumer --

3 MR. HOLLEY: This is called in re Microsoft
4 Corporation antitrust litigation, Your Honor.

5 THE COURT: I know.

6 THE WITNESS: What is the page?

7 BY MR. HOLLEY

8 Q. What is the date?

9 A. No, the page.

10 Q. I'm sorry. I'm looking at page 32, starting at line
11 18.

12 Apparently this went on for days, and I have just given
13 you the wrong one.

14 A. Do you know the page numbers?

15 Q. I think it is this one.

16 Mr. Alepin, and I know it is hard for you with one
17 hand, but I'm looking at page 32, line 18.

18 A. My page numbers begin at 220.

19 Q. I guess the third time is the charm.

20 MR. SCHMIDTLEIN: You're just trying to get rid of
21 all of your papers.

22 MR. HOLLEY: I am trying to kill more trees.

23 THE WITNESS: Do you want this one back?

24 BY MR. HOLLEY

25 Q. Yes, I will take it back. Sorry.

1 Got it?

2 A. I have got it.

3 Q. So the question was asked of you, Mr. Alepin, and I
4 want to know -- you told me some things in the 1990s, but
5 then I thought I understood you to say that really was
6 not -- that was either middleware or something other than PC
7 operating systems design development experience. And what I
8 want to know is have you had any PC operating systems design
9 or development experience, you personally, aside from what
10 you did in the mid 1980s -- excuse me -- with this fashion
11 automation software? Answer, no, not that I can recall.

12 Do you recall giving that testimony, sir?

13 A. That is correct. Yep.

14 Q. Now, Mr. Alepin, you're not an expert in the design of
15 word processing applications, are you, sir?

16 A. No, I am not an expert in the design of word
17 processing.

18 Q. And you're not an expert in the design of spreadsheet
19 applications, are you, sir?

20 A. No.

21 Q. In fact, in the same 2003 deposition, and if you look
22 at page 33, line 3, you testified that you had zero
23 experience working on applications for PC operating systems;
24 isn't that right?

25 A. Excuse me. I am reading it.

1 Q. Sure.

2 A. Thank you. I see that.

3 What was the question?

4 Q. My question to you was whether you recall saying in
5 your 2003 deposition that you had zero experience working on
6 application software for PC operating systems?

7 A. I recall that. I don't think that is correct anymore,
8 but --

9 Q. What PC -- excuse me. What --

10 A. In 2003 that was accurate.

11 Q. Okay. And can you tell me, sir, what applications for
12 PC operating systems you have designed or developed since
13 2003?

14 A. A system for the tracking of the availability of web
15 sites and the recording of the operational status of web
16 sites around the United States.

17 Q. Okay. But if we limit ourselves to word processing
18 applications and that run on PCs, spreadsheet applications
19 that run on PCs, relational databases that run on PCs, and
20 presentation graphics software products that run on PCs, the
21 answer you gave in 2003 remains true in 2011.

22 Is that not right, sir?

23 A. Sir, you're asking for personal productivity
24 applications, you're not asking for applications software as
25 that term is --

1 Q. Yes, sir. I'm talking about what I guess you would
2 call office applications or personal productivity
3 applications. And the answer still is, as we sit here
4 today, that you have zero experience in the design or
5 development of those products, correct?

6 A. No.

7 Q. Well, can you tell me, sir, which office productivity
8 applications, as you and I have now understood that term,
9 that you have designed or developed between your deposition
10 in 2003 and today?

11 A. I have worked on the spelling and spellchecking and
12 spell correcting portions of word processing.

13 Q. For which company?

14 A. With Yeda University in --

15 Q. I'm sorry?

16 A. Yeda, Y-e-d-a, in Israel.

17 Q. Anything else that you can tell me about your
18 experience in personal productivity applications, designs or
19 development between 2003, when you said that you had zero
20 experience, and today?

21 A. No. Not as I am sitting here, no.

22 MR. HOLLEY: Your Honor, in light of this
23 testimony Microsoft opposes the qualification of Mr. Alepin
24 as an expert.

25 THE COURT: Do you have any more questions, Mr.

1 Schmidtlein? I am not suggesting that you have to have any,
2 but --

3 MR. SCHMIDTLEIN: No more questions.

4 THE COURT: Okay. I am going to generally qualify
5 Mr. Alepin as an expert. As you all know, I am pretty much
6 a -- if you have a specific problem, Mr. Holley, let me know
7 and approach the bench. I will generally qualify him.

8 Ladies and gentlemen, I will give you a more
9 formal instruction about this later, but being qualified as
10 an expert is somebody who can give you their opinion in an
11 area of their expertise. Normally, as you know, you come
12 into court and talk about facts and things that you
13 observed. There are a couple of exceptions to that. One of
14 them is for expert testimony. Somebody can actually come in
15 and give you their opinion, and that is what it means to be
16 qualified as an expert.

17 Mr. Schmidtlein.

18 MR. SCHMIDTLEIN: Your Honor, if I may, can we
19 take a short break?

20 THE COURT: Sure.

21 MR. SCHMIDTLEIN: Thank you.

22 THE COURT: I'm ready any time you all are.

23 MR. SCHMIDTLEIN: Thank you, Your Honor.

24 (Recess)

25 THE COURT: We will take another break around

1 10:00.

2 MR. SCHMIDTLEIN: Thank you, Your Honor. We
3 appreciate the Court's indulgence.

4 (WHEREUPON, the jury enters the proceedings.)

5 THE COURT: Just so you all know, we'll of course
6 take a break when anybody needs one, but if nobody needs one
7 before 10:00 we'll take one around 10:00.

8 Mr. Schmidtlein.

9 MR. SCHMIDTLEIN: Thank you, Your Honor.

10 DIRECT EXAMINATION (Cont.)

11 BY MR. SCHMIDTLEIN

12 Q. Mr. Alepin, the jury has patiently listened already a
13 lot about software and various different acronyms, so I'm
14 not going to have you sort of teach the full semester course
15 here, and hopefully we'll sort of hit some of the
16 highlights.

17 Can you quickly just describe what a computer operating
18 system does?

19 A. Quickly --

20 Q. Pull the mike in front of you there. That will make it
21 easier for everybody.

22 A. Better? Okay.

23 A computer operating system is actually a collection of
24 software modules sometimes called a program that manage the
25 hardware that is attached to the computer, that manages the

1 resources on the computer, resources are memory and time,
2 C.P.U. time, the time it takes to execute the program, so
3 that programs that the user wants to operate will run
4 effectively and reliably. So the operating system's job is
5 managing hardware and allocating resources to programs that
6 the user wants to run.

7 The operating system also provides a mechanism to allow
8 the user to tell it what it is supposed to do. So the
9 operating system relies on the user's instructions to
10 establish what programs to run and when to run them, and
11 what to do with the results and what to do with it when they
12 are finished. That is it in a nutshell.

13 To run the programs the operating system provides a set
14 of interfaces that allow the programs that are running on
15 the computer and on the operating system to request and
16 receive the results of services that the operating system
17 provides. So if the operating system provides a means for
18 the programs to ask for memory, it says I need more memory,
19 the operating system provides an API, an interface where the
20 program can ask for the memory and the operating system can
21 give the program memory and tell them where the memory is
22 located.

23 There are lots of things that programs want, so there
24 are lots of programming interfaces to accommodate the needs
25 of programs. Historically we started out with operating

1 systems that were very small and did very little for
2 programs and very little for users. Some of you may
3 remember a green screen or a black screen and typing little
4 commands, and you compare that with today with flashy icons
5 and moving pictures and drag and drop and all of this kind
6 of stuff on a big, fancy desktop, and that is because there
7 is a lot more functionality and a lot more interfaces in
8 operating systems.

9 Q. You testified earlier this morning about your extensive
10 experience working with mainframe computer operating
11 systems. Mr. Holley asked you some questions about PC
12 computer operating systems. Kind of on a very high level
13 can you kind of compare mainframe operating systems with PC
14 operating systems?

15 A. Yes, I can.

16 THE COURT: Please do so.

17 THE WITNESS: Thank you.

18 I made mention of the fact that it is not too far
19 back in memory when personal computer systems had screens
20 and you would type commands on the line next to a C prompt
21 or something like that, and mainframe operating systems have
22 been around for a lot longer and have evolved to perform
23 many of the functions that only now today's PC operating
24 system are undertaking.

25 The mainframe computer systems do them in ways

1 that reflect the fact that businesses, corporations,
2 enterprises, hospitals, run their mission critical
3 businesses on mainframe computers. And, accordingly, the
4 operating system has to be more robust and can't break and
5 has to be able to suffer multiple failures in the components
6 of the operating system and still keep running. It is not
7 possible to get a blue screen and say, whoops, sorry,
8 restart your computer.

9 Mainframe computer systems have got redundancy
10 designed into the operating system, protection and security
11 designed into the operating system so that it is not
12 possible to crash or to sneak in and obtain information from
13 another application that is running. There are all kinds of
14 mechanisms in operating systems for mainframe computers that
15 are significantly more involved and significantly more
16 sophisticated than those that are available on PCs.

17 However, PCs increasingly are making strides to
18 incorporate the functions, oftentimes borrowing them,
19 borrowing the concepts from mainframe computers to apply
20 them to personal computers.

21 BY MR. SCHMIDTLEIN

22 Q. What particular operating system did you focus on in
23 coming to your opinions in this case?

24 A. In this case I focused on the Windows 95 operating
25 system and its predecessor developing system, Chicago, the

1 Chicago beta system, the code name for the Windows 95
2 operating system.

3 Q. When was Windows 95 released?

4 A. August 24th or 25th of 1995.

5 Q. Do you know sort of roughly the development time period
6 during which Windows 95 was developed?

7 A. Windows 95 was under development from I would say 1992
8 until its release in 1995, although there was some
9 discussion of the next version after Windows 3.1 possibly as
10 early as 1991.

11 Q. You're familiar with the term ISV, correct?

12 A. Yes.

13 Q. What does ISV stand for?

14 A. ISV stands for independent software vendor.

15 Q. What are ISVs? What is an independent software vendor?

16 A. Well, independent software vendors are called
17 independent because they are not part of a hardware company
18 or an operating system company. The term is important
19 because it helps to distinguish them from products or
20 services that are being developed by the -- I'll use a term
21 of art here -- by the platform maker. So they are
22 independent of the platform maker.

23 Q. Are you familiar with the interactions that typically
24 take place between ISVs and operating system developers
25 during the operating system development process?

1 A. Yes.

2 Q. Can you describe those generally?

3 A. Well, the operating system vendor needs independent
4 software vendors, and the operating system vendor needs them
5 for a couple of reasons. He needs them to develop their
6 software products to run on the operating system. It is not
7 really a good idea to have an operating system and to build
8 it and then nobody comes, because you need applications to
9 run on your operating system, because people buy computers
10 to run applications not to run operating systems. That is
11 an important thing.

12 The first thing is operating system vendors communicate
13 with independent software vendors to encourage them to
14 develop and to plan to develop their applications for the
15 new operating system that we're planning on building. That
16 is number one.

17 The second thing is operating system vendors need
18 independent software vendors because independent software
19 vendors are close to users and they understand what the
20 users want and need. They have good ideas about what the
21 operating system vendor should incorporate into the
22 operating system in order to make it helpful for the
23 application of software vendors to develop their application
24 for the operating system. So you have those two reasons or
25 those two interactions on the operating system vendor's

1 side.

2 On the application vendor's side, the application
3 vendor wants, the independent software vendor wants a
4 heads-up about what the future is going to be like from the
5 operating system vendor's point of view. What are you going
6 to do and when are you going to do it? And how will that
7 help me get my product and make it better for my customers?
8 So there is that interaction on the other side.

9 Q. Are you familiar with the term beta release as it is
10 used in the software industry?

11 A. Yes, I am.

12 Q. Can you describe that?

13 A. Sure. So a new product -- so beta is a term that we
14 use that applies to not just operating systems but it
15 applies to almost all software development now in the
16 market. It represents the last step before the product is
17 finished and made available for customers.

18 Usually you go through maybe a customer technology
19 preview phase where you show them some pictures and some
20 mock-ups of what you're thinking of doing. You then go
21 through an alpha phase where you make little pieces of
22 software and of what you're planning to do and are available
23 for people, independent software vendors to see. And then
24 you go through beta phases where those parts of the
25 operating system that are available earlier are packaged

1 together and given to the beta testers, the independent
2 software vendors, so that they can test and give all their
3 programs to use the new features in the operating system.

4 Q. Have you reviewed beta releases of operating system
5 software?

6 A. I have.

7 Q. In your experience do software developers typically
8 make significant changes to software functionality after the
9 release of a beta version of their software?

10 THE COURT: You mean operating system?

11 MR. SCHMIDTLEIN: Yes.

12 THE WITNESS: I think that the best way to answer
13 that is that the outward looking part of the system is
14 rarely changed in the beta. It would be exceptional to
15 change the interfaces that the operating system provides.
16 Once they are in the operating system it is extremely rare
17 to change them.

18 Inside, however, things are being fixed. Part of
19 the beta process is to identify bugs. So you say this is
20 supposed to work this way. It does not work this way. They
21 go ahead and they fix it. So there are changes under the
22 covers that are made during the beta process, but those
23 changes take place inside under the covers of the operating
24 system, and not at the interfaces with the product that has
25 been described as being capable of doing or available to do.

1 BY MR. SCHMIDTLEIN

2 Q. You have made reference to the term API and the jury
3 has heard it probably every day for the last several weeks.
4 API stands for application programming interface; is that
5 right?

6 A. That is correct.

7 Q. From your perspective describe what an API is.

8 A. Well, it is an interface. It is a point of connection
9 or attachment. As I mentioned before, the software product
10 has lots of interfaces and the interfaces between the
11 operating system and the application is called an
12 application programming interface. It is a programmable
13 connection between the application program and the operating
14 system that performs a specific function, and the API is the
15 definition of what that service is.

16 It is the rule that you follow in order to -- I used
17 the example of asking for more memory. That is an API. It
18 has a certain set of requirements that the application
19 program must follow in order to make the request, to use the
20 API. It will receive a certain set of defined results when
21 the operating system performs the function requested by the
22 API.

23 Q. Are you familiar with something called the RNA API?

24 A. Yes.

25 Q. What is that?

1 A. That is -- Microsoft provided a set of interfaces,
2 remote networking interfaces that are part of Windows 95
3 that allow programs to use the dialer mechanism inside
4 Microsoft Windows 95.

5 Q. You made reference to the dialer mechanism. What is
6 that?

7 A. Well, the Windows -- it is hard looking back all those
8 years to when people used modems and telephone lines to
9 communicate with AOL, and some people still do, and the
10 modem was controlled by software that would send a set of
11 commands to the modem, telling it to turn itself on and to
12 set itself at a speed and to dial a telephone number.
13 Windows 95 offered a set of programming interfaces that
14 allowed the program to select a telephone number that had
15 been stored previously and to dial that telephone number
16 across the modem.

17 Q. Are you familiar with a product called Netscape
18 Navigator?

19 A. Yes, I am.

20 Q. Was the RNA API something that from a technical
21 standpoint was important for a product like Netscape
22 Navigator?

23 MR. HOLLEY: Objection, Your Honor. We are now
24 having the witness testify about things that are
25 collaterally estopped.

1 THE COURT: Overruled.

2 BY MR. SCHMIDTLEIN

3 Q. Do you want me to repeat the question?

4 A. Please.

5 Q. Let me back up.

6 A. Okay.

7 Q. What is Netscape Navigator?

8 A. Netscape Navigator was the first --

9 THE COURT: While he answers that, my ruling
10 stands. You have an objection to all, and you don't have to
11 object each time.

12 MR. HOLLEY: Thank you, Your Honor.

13 THE WITNESS: Netscape Navigator was the first
14 browser, the one that caught everybody's attention and sort
15 of was there for the Internet revolution.

16 BY MR. SCHMIDTLEIN

17 Q. When was Netscape Navigator developed?

18 A. The first release of Netscape Navigator was in December
19 of 1994, although there were earlier versions that were
20 available before that.

21 Q. Let me come back to the question I asked you before.

22 Was the RNA API something that from a technical standpoint
23 was important for a product like Netscape Navigator?

24 A. Yes.

25 Q. Can you explain why?

1 A. Well, Windows 95 was going to have this dialer
2 mechanism available to it with an address book and means for
3 storing addresses and allowing users to dial out with their
4 favorite program for online services.

5 You had at the time AOL and Compuserve, and you also
6 had newly emerging Microsoft Network and you had Netscape
7 Navigator. It would be desirable that the user's access to
8 the dialer would be consistent, and there would be a single
9 point by which the user would get out to the modem, so that
10 there would be different programs using different address
11 books and with different dialers to get outside of Windows
12 95. Netscape Navigator would benefit from being able to use
13 the same one, a common one.

14 Q. We're going to come back to APIs again in a little
15 while.

16 Have you prepared some slides to sort of work our way
17 through some of your technical opinions in this case?

18 A. Yes, I have.

19 MR. SCHMIDTLEIN: May I approach?

20 THE COURT: Sure.

21 BY MR. SCHMIDTLEIN

22 Q. Mr. Alepin, these will be up there and on there, but if
23 you want a hard copy you'll have a hard copy as well.

24 Mr. Alepin, did you prepare a summary side with sort of
25 your three overarching opinions in this case?

1 A. Yes, I did.

2 MR. SCHMIDTLEIN: Can we go to that slide?

3 BY MR. SCHMIDTLEIN

4 Q. Do you see these three bullet points? WordPerfect and
5 other Novell technologies were middleware. The second one,
6 no legitimate technical justification for de-documenting and
7 withdrawing support for the namespace extension APIs.
8 Three, no legitimate technical justification for Microsoft's
9 manipulation of the messaging application programming
10 interface.

11 Are those sort of --

12 THE COURT: I'm sorry. I may have a previous --

13 THE WITNESS: That is different from the --

14 THE COURT: I may have a previous version.

15 MR. SCHMIDTLEIN: Yep.

16 THE COURT: Let me just show you what I have got.

17 THE WITNESS: You have the right one.

18 MR. SCHMIDTLEIN: We have a technical snafu.

19 THE COURT: Do I have the right one?

20 THE WITNESS: You do.

21 MR. SCHMIDTLEIN: He has the wrong one there.

22 THE COURT: So there were --

23 MR. SCHMIDTLEIN: You are correct, and I noticed
24 it myself up here, Your Honor.

25 THE WITNESS: I did, too.

1 THE COURT: You can use mine, if you want.

2 MR. SCHMIDTLEIN: No. I have got one as well,
3 just in case you need that.

4 THE WITNESS: Thank you, Your Honor.

5 BY MR. SCHMIDTLEIN

6 Q. Let's go to your first opinion -- we'll come back to
7 that.

8 The third one is the one where the wording is not
9 right, and we're not going to get to that one until number
10 three. So let's go to the number that has the first
11 overarching slide.

12 MR. SCHMIDTLEIN: Pull that one up about
13 middleware.

14 There we go.

15 BY MR. SCHMIDTLEIN

16 Q. Is this one of the opinions that you are prepared to
17 testify to?

18 A. Yes.

19 Q. Do you have a slide prepared that talks about this
20 opinion?

21 A. Yes, I do.

22 MR. SCHMIDTLEIN: Can we go to that next slide?

23 BY MR. SCHMIDTLEIN

24 Q. Okay. Again, this is just sort of facilitating and
25 moving things --

1 THE COURT: That is fine.

2 MR. SCHMIDTLEIN: -- efficiently here.

3 BY MR. SCHMIDTLEIN

4 Q. Can you tell the jury --

5 A. There is something on the front of this screen here.
6 It is gone. Thank you.

7 Q. You're familiar with the term middleware?

8 A. Yes, I am.

9 Q. The first bullet point there, software that runs on top
10 of an operating system and exposes APIs that encapsulate
11 meaningful functionality.

12 Is that sort of the definition of middleware that
13 you're comfortable with?

14 A. Yes.

15 Q. And the second bullet point there, if applications are
16 written to run on APIs exposed by middleware, the operating
17 system is rendered less relevant.

18 Can you describe that?

19 A. Well, what that is intended to convey is the
20 observation that as an application program uses more of the
21 middleware's APIs rather than the operating systems APIs,
22 the application will be less dependent on the operating
23 system, and will require fewer changes to move from one
24 operating system to another operating system.

25 Q. And I see the next point you have got is if middleware

1 is cross-platformed, it significantly lowers the cost for
2 developing software that runs on multiple operating systems.

3 Can you briefly describe what you mean by
4 cross-platformed there.

5 A. By cross-platform I intended here to say that if a
6 piece of middleware, the middleware software package makes
7 itself available on let's say Macintosh and on the PC, then
8 the middleware can be considered to be cross-platformed if
9 it makes the same programming services available on both
10 platforms, on both the Macintosh and the PC. So
11 cross-platform is a way of saying that the APIs are
12 available across multiple different platforms.

13 MR. SCHMIDTLEIN: We have taken the risk of trying
14 to prepare a demonstrative that might visually help explain
15 this to the jury.

16 Can you put that up? Okay.

17 BY MR. SCHMIDTLEIN

18 Q. Can you, sort of using this admittedly sort of very
19 primitive demonstrative, explain some of the points that you
20 were just talking about?

21 A. All right. Well, here we have an example of an
22 application, application A that is using the APIs, the
23 application programming interfaces of operating system A.
24 You can see that on the left-hand side. And that
25 application, that same application to run on operating

1 system B would have to be modified to run -- to use the APIs
2 that were available on operating system B. The way for
3 asking for memory, for example, is likely to be different
4 between the two operating systems.

5 So if I want to take application A and run it on
6 operating system B, it is likely that I'll have to change
7 the way that I ask for memory, for example. The number of
8 APIs that I use in my system may make this -- the more I use
9 the APIs, the operating system, the more changes I will have
10 to make to get the application to be able to use operating
11 system B's APIs.

12 MR. SCHMIDTLEIN: Can we go to the next
13 demonstrative?

14 Okay.

15 BY MR. SCHMIDTLEIN

16 Q. This demonstrative has sort of an additional layer
17 included in there called middleware. Can you sort of take
18 the jury through the implications of this middleware for
19 software developers?

20 A. All right. So what has happened here is the
21 application program has been coded to use the middleware
22 APIs to perform functions that it could have otherwise used
23 the operating system's API to perform. And in that case
24 what has happened is the middleware software program has
25 taken on the responsibility of adapting the request, like a

1 request for memory, and adapting it to the particular needs
2 of the operating system on which today the application is
3 running. So what the software developer who owns
4 application A can do, is run his application on different
5 platforms without making changes to the application. That
6 is kind of the big payoff at the end of the middleware
7 rainbow.

8 Q. We sort of simplified this, and we tried to make a lot
9 different versions of this to be simple, and this was the
10 best that we could do, but oftentimes the case is is that
11 you may have for a middleware product to be cross-platformed
12 and run on both of these, this might actually be sort of two
13 different versions of the middleware; is that right?

14 A. Absolutely. Yes. Yes.

15 Q. So the APIs or the interfaces that are connecting here
16 may be different depending on which operating system you're
17 running?

18 A. That is what the diagram is intended to convey, yes.
19 The APIs on the left-hand side inside the middleware would
20 be different than the APIs inside the middleware on the
21 right-hand side dealing with different operating systems.

22 Q. Does the software developer who is up here, sort of
23 care about the differences down here?

24 A. No, he does not.

25 Q. For him the important part is this layer here is the

1 same regardless of which operating system?

2 A. Yes.

3 MR. HOLLEY: Your Honor, could you ask
4 Mr. Schmidtlein to stop leading the witness?

5 THE COURT: Well, he knows that. He was just
6 explaining it and to sort of simplify --

7 BY MR. SCHMIDTLEIN

8 Q. Mr. Alepin, did you prepare a slide that sets forth
9 some examples of middleware?

10 A. Yes.

11 Q. I want to sort of go through these quickly. You talked
12 a little bit about --

13 THE COURT: I just want to clarify what I said
14 before. We may be getting into the same area as before to
15 which an objection was made, and I think I forgot to use the
16 word continuing. There is a continuing objection on the
17 issue of collateral estoppel and testimony about that.

18 MR. HOLLEY: Thank you, Your Honor.

19 BY MR. SCHMIDTLEIN

20 Q. You have testified I think previously and described
21 that Netscape Navigator was sort of one of the early popular
22 browsers. Can you explain how Netscape Navigator falls into
23 the class of middleware?

24 A. Well, Netscape Navigator was, in addition to being a
25 browser, it allowed for the development of applications that

1 made use of information that was obtained from the network.
2 So we had browser plug-ins, for example, that would allow
3 programs, let's say, from Adobe Acrobat Reader to read PDFs
4 inside the browser window. You would have a plug-in that
5 would allow you to see the PDF documents without having to
6 download the document and open another window to read the
7 PDF. You could run Flash Animation in your browser window
8 because of plug-ins.

9 The programmers could write programs that worked inside
10 the Netscape Navigator and provided important services that
11 customers who were using the browser would enjoy.

12 Netscape Navigator also provided scripting language.
13 We called it Java script. That enabled people who were
14 sending in web pages to include little programs inside the
15 web page, not just malware, but actual programs that did
16 important things like give you drop down menus and allow you
17 to change some of the contents of the page. In fact, to
18 actually do work, so that you could use the Java script
19 language inside of the web page to actually program small
20 applications.

21 Netscape also included the Java -- the programming for
22 Java Virtual Machine, which allowed programmers to develop
23 full-on business applications and transport them from a
24 server over the Internet to the browser and have them
25 execute in the browser. So Netscape offered an increasingly

1 broad platform for the development of applications where you
2 would not leave the browser and you would not see the
3 operating system.

4 Q. Can you describe -- what are Sun Microsystems Java
5 technology and how did they constitute middleware?

6 A. Java technologies includes the Java Virtual Machine,
7 which I just mentioned, as well as the Java interpreter and
8 Java application frameworks, which allowed programmers to
9 develop applications which were sort of -- the catch phrase
10 was write once, run everywhere. The objective was that a
11 programmer could write a program in Java using the
12 frameworks, using the programming language, and test it once
13 and then it could run on any computer with any kind of
14 hardware, as long as there was a Java Virtual Machine there.

15 So write once, run everywhere, was seen as a great boom
16 for programmers and developers because it unlocked
17 applications from platforms, and you could choose what
18 hardware you wanted to run today with these applications and
19 change your decision about the hardware tomorrow or the next
20 day.

21 Q. The next bullet that you have on your slide is Lotus
22 Notes.

23 Can you describe what Lotus Notes is?

24 A. Lotus Notes is a groupware software. Groupware is a
25 popular software category and, in fact, it was a very

1 popular software category in the early 1990s and throughout
2 the -- excuse me -- continuing to today, of course, but it
3 provided the kind of collaboration tools that enterprises --
4 when I say enterprises I am talking about businesses and
5 governments and educational institutions, so kind of a
6 broader term of enterprises, and so not small home or home
7 office users, but enterprises on the other side of the
8 market.

9 Those enterprises could use this to collaborate and
10 work together. So it was for teams working together. You
11 could have calendaring and e-mail and contacts, and you
12 could have libraries of documents, and, like today, we have
13 logs and bulletin boards and other areas where people meet
14 to exchange information and search through for -- you could
15 search through for recipes. You can imagine a search
16 through what people have written about a particular store or
17 a review of a restaurant.

18 Well, inside an enterprise you might have similar needs
19 to write documents and to be able to find those documents.
20 Who was the last person who talked to this customer and what
21 did they say? How soon are they going to be ready to make a
22 decision about buying our product? You want the members of
23 the team to be able to search through these libraries of
24 documents written by team members, and maybe follow up or
25 exchange information with the person who was responsible.

1 So groupware was a very exciting and very popular
2 platform. It became a platform for the development of other
3 applications that related to just these basic groupware
4 functions. So you might -- what I mean by that, a platform
5 here was application developers started to make use of
6 information in e-mail systems and in the library system to,
7 let's say, set a routing and approval scheme for their
8 group. I would group a message for expense account approval
9 to my manager, and that would have a certain time limit, and
10 once that expense account was routed and approved it would
11 go to the accounts payable department and they would issue a
12 check. I could set up those kinds of applications based on
13 the information that was in the groupware database to create
14 the middleware platform.

15 Q. Did in the 1990s and sort of up through today, ISVs
16 write applications that would run on Lotus Notes?

17 A. Yes. Lotus Notes provided a complete set of tools to
18 develop applications for independent software vendors, yes.

19 Q. The next bullet is Novell Technologies. There are
20 several sort of sub bullet points there. Let's start with
21 WordPerfect.

22 Did WordPerfect meet your definition of middleware?

23 A. Yes, it did.

24 Q. Can you explain that?

25 A. Well, WordPerfect provided a set of services which were

1 available to independent software vendors to build
2 applications that worked with the WordPerfect document
3 processing capabilities.

4 Q. The next bullet there is PerfectFit, slash, shared
5 code.

6 What are those?

7 A. Well, increasingly the vision of WordPerfect and Novell
8 was to deliver a fully integrated desktop office application
9 environment. What I mean by that is they wanted to
10 integrate applications that users typically used for
11 personal productivity, including spreadsheets, including
12 database, including word processing and groupware, groupware
13 activities, e-mailing and calendaring and address book, so
14 they wanted to integrate those functions and make the
15 platform extensible.

16 They took the products that they had, WordPerfect and
17 QuatroPro and Paradox, and they put them on top of what came
18 to be known as shared code and PerfectFit technologies and
19 made those services in the form of APIs, that not only those
20 programs could call but other programs like the word
21 processor program would work together to offer a more
22 valuable solution for somebody in an office environment.

23 So you might have -- an easy one is I want to
24 spellcheck no matter what program I am in. So if I'm in the
25 word processor and I want to use the spellchecker service,

1 if I am in a spreadsheet program and I have headings for my
2 columns and I want those spellchecked, or I am in a database
3 and I want my information that I have typed in in the
4 comments to be spellchecked. I can use the same
5 spellchecking service to do that. So I have a set of common
6 programming services for all of my applications, and I make
7 that available to third parties, as well as I publish it to
8 make somebody who has got something else that is a
9 complimentary program to my word processing program, and
10 they can sit on top of my platform.

11 Q. What is the next bullet there that talks about appware
12 and open doc? What is appware?

13 A. Appware is an application framework. This is a concept
14 that emerged in the early 1990s really. It was a set of
15 programming interfaces, APIs really, that were set at a high
16 level.

17 THE COURT: I'm sorry. I didn't realize it is
18 past 10:00. I hate to interrupt you, but the court
19 reporters I think need to take a break. I am sorry to
20 interrupt you. I just overlooked the clock.

21 MR. SCHMIDTLEIN: That is fine. Thank you.

22 THE COURT: I am ready whenever everybody else is.

23 (Recess)
24
25
