Federal Statutes

35 U.S.C. § 284.....6

1 inventions in 2006. In fact, the Federal Circuit has made clear that, where there is good evidence
2 of what the parties anticipated at the time of the hypothetical negotiation, it is of no moment
3 whether those expectations were actually realized. To the extent the Federal Circuit has allowed
4 hypothetical negotiators to “peek into the future,” it has been as a check on the reasonableness of
5 conclusions reached through other means, not to arrive at those conclusions in the first instance.

6 In this case in particular it would make no sense to calculate the present values of features
7 as a proxy for their values in 2006. Unlike in many infringement cases, Google and Sun actually
8 engaged in negotiations around the time of alleged first infringement for a technology
9 partnership that would have included an intellectual property package containing all the asserted
10 patents and copyrights. Although the parties did not fix a price for any of the individual patent
11 claims or copyrighted material now at issue, Sun must have understood all the components of the
12 package it was offering—its patent portfolio, copyrights, the JAVA trademark, other know-how,
13 and cash payments to replace potential lost revenue—and the general value of those components.
14 As Sun’s successor, there is no reason why, in preparing its damages expert reports, Oracle could
15 not have apportioned that package to account for each of its components.

16 Equally important, the parties’ real-world negotiations placed a defined upper limit on the
17 aggregate value of the complete Sun package. One possible upper limit, which Oracle’s expert
18 used in his most recent report, was Sun’s \$100 million demand to Google in March 2006.
19 Another possible upper limit, as Google has urged, was the subsequent \$28 million demand Sun
20 later made in June 2006 for the same package. But regardless of which figure is used, any upper
21 limit set during the parties’ actual negotiations around the time of first infringement—when the
22 success of Android was uncertain—would be significantly lower than the present value of *the*
23 *entire Android platform*, which would be the starting point under the approach contemplated in
24 the Order. Calculating Oracle’s damages as a percentage of the current value of Android would
25 almost certainly have the effect of inflating damages even beyond the “vast sums,” Order at 3,
26 Oracle put forth in its previous damages reports. It would also violate federal law by substituting
27 Google’s *profits* for Oracle’s *damages*—an approach disavowed by Congress in 1946, when it
28 amended the patent statute specifically to eliminate an infringer’s profits as a measure of

1 damages, and further condemned by *Georgia-Pacific*, the grandfather of reasonable-royalty case
 2 law. *See* 243 F. Supp. at 519, 521-22, 525. And it would not make the experts' apportionment
 3 task any easier, since the myriad types of know-how that enable the relevant features of Android
 4 were not a subject of discovery in this case.

5 The Court's initial instinct in the July 22, 2011 order was right. The reasonable royalty
 6 analysis should be based on the value of the patents and copyrights in suit at the time of the
 7 hypothetical negotiation in 2006, and the correct way, both logically and legally, to attack that
 8 problem is by taking a close look at the parties' actual 2006 negotiations.

9 II. ARGUMENT

10 A. Under clearly established Federal Circuit case law, a reasonable royalty must be 11 based on the parties' reasonable expectations at the time of alleged first 12 infringement, not on subsequently occurring market facts after infringement.

13 For the past decade, the Federal Circuit has consistently ruled that a reasonable royalty in
 14 a patent case must be determined based on the parties' "*sales expectations at the time when*
 15 *infringement begins ... as opposed to an after-the-fact counting of actual sales.*" *Interactive*
 16 *Pictures Corp. v. Infinite Pictures, Inc.*, 274 F.3d 1371, 1373 (Fed. Cir. 2001) (emphasis added).¹
 17 Based on this rule, Oracle cannot use the present-day value of Android features—which, after
 18 all, can be measured only by calculations akin to "an after-the-fact counting of actual sales"—as
 19 a stand-in for the value the parties would have expected from those features in mid-2006.

20 The Federal Circuit's *Interactive Pictures* decision explains that expectations—not after
 21 the fact actual numbers—are what form the basis for a hypothetical negotiation. There, the
 22 plaintiff's damages expert relied on an annual sales projection prepared by the defendant two
 23 months before infringement began. *Id.* at 1384. The defendant disavowed its own projection as

24 ¹ *See also, e.g., Lucent Technologies v. Gateway, Inc.*, 580 F.3d 1301 (2009) ("The hypothetical
 25 negotiation tries, as best as possible, to recreate the *ex ante* licensing negotiation scenario and to
 26 describe the resulting agreement."); *Integra Lifesciences I, Ltd. v. Merck KGaA*, 331 F.3d 860,
 27 869 (Fed. Cir. 2003) (reversing jury verdict for lack of substantial evidence where royalty
 28 determination set at time following first infringement); *Riles v. Shell Exploration & Prod. Co.*,
 298 F.3d 1302, 1311 (Fed. Cir. 2002) (determination of a reasonable royalty "contemplates a
 hypothetical negotiation between the patentee and the infringer at a time before the infringement
 began."); *Hanson v. Alpine Valley Ski Area, Inc.*, 718 F.2d 1075, 1079 (Fed. Cir. 1983) (the "key
 element in setting a reasonable royalty ... is the necessity for return to the date when the
 infringement began").

1 “speculative,” pointing out that its actual sales had fallen short of expectations. *Id.* The Federal
2 Circuit disagreed, rejecting the use of hindsight:

3 [We have] endorsed the conceptual framework of a hypothetical negotiation
4 between the patentee and the infringer as a means for determining a reasonable
5 royalty. ***When that framework is employed, the negotiation must be***
6 ***hypothesized as of the time infringement began.*** . . . In this case, the 1996
7 business plan and its projections for future sales were prepared by [defendant] two
8 months before infringement began. Thus, rather than being outdated for purposes
9 of the hypothetical negotiation, those projections would have been available to
10 [defendant] at the time of the hypothetical negotiation. The fact that [defendant]
11 did not subsequently meet those projections is irrelevant to [defendant’s] state of
12 mind at the time of the hypothetical negotiation. ***Nor does [defendant’s]***
13 ***subsequent failure to meet its projections imply that they were grossly excessive***
14 ***or based only on speculation and guesswork.*** Instead, [defendant’s] subsequent
15 failure to meet its projections may simply illustrate the element of approximation
16 and uncertainty inherent in future projections.

17 *Id.* at 1384-85 (emphases added). *Interactive Pictures* made clear that the controlling evidence
18 for purposes of setting a royalty rate must be the parties’ reasonable expectations at the time of
19 first infringement. It explicitly rejected the notion that prior Federal Circuit case law

20 require[d] that estimates of sales revenues, as referenced in a hypothetical
21 negotiation at the time infringement began, must later bear a close relation to
22 actual sales revenue. ***Such a proposition would essentially eviscerate the rule***
23 ***that recognizes sales expectations at the time when infringement begins as a***
24 ***basis for a royalty base as opposed to an after-the-fact counting of actual sales.***

25 *Id.* (emphasis added).

26 This is consistent with the Federal Circuit’s treatment of this question since the court’s
27 formation. In *Hanson*, its first case to consider the issue, the defendant appealed a verdict
28 awarding a very large royalty. *See* 718 F.2d 1075, 1077 (Fed. Cir. 1983). The defendant argued
that the royalty was too high to be reasonable, because it would make it impossible for the
defendant to turn a profit. The Federal Circuit rejected that argument, explaining that the key
issue was what the parties would have agreed to at the time of first infringement, regardless of
whether that royalty was one the defendant would have agreed to after the fact. A reasonable
royalty should “be determined ***not on the basis of a hindsight evaluation of what actually***
happened, but on the basis of what the parties to the hypothetical license negotiations would
have considered at the time of the negotiation.” *Id.* at 1081 (emphasis added); *see also Radio*
Steel & Mfg. Co. v. MTD Prods. Inc., 788 F.2d 1554, 1557 (Fed. Cir. 1986).

1 Oracle may point to a series of Federal Circuit cases allowing hypothetical negotiators to
2 “peek into the future.” But these cases simply affirm the uncontroversial *Georgia-Pacific*
3 principle that post-negotiation information can be used to *support* the reasonableness of a royalty
4 calculation based on facts known at the time. After all, one of the 15 non-exclusive factors in the
5 *Georgia-Pacific* analysis is “[t]he established profitability of the product made under the patent;
6 its commercial success; and its current popularity.” 318 F. Supp. at 1120.

7 For example, in *Trans-World Mfg. Corp. v. Al Nyman & Sons, Inc.*, 750 F.2d 1552 (Fed.
8 Cir. 1984) the Federal Circuit reversed because the district court had refused to allow plaintiff to
9 introduce any evidence of defendant’s actual profits as part of its reasonable royalty case. *See*
10 750 F.2d at 1566. It cited factor 8 of the *Georgia-Pacific* test, noting that “[e]vidence of the
11 infringer’s actual profits generally is admissible as probative of his anticipated profits.” *Id.* at
12 1568. But it also “express[ed] no opinion concerning the weight, if any, to be given such
13 evidence or any conditions that might properly be imposed upon its admission; we indicate only
14 that we do not think the district court should have excluded it.” *Id.* Likewise, though *Fromson*
15 *v. Western Litho Plate and Supply Co.*, 853 F.2d 1568 (Fed. Cir. 1988), noted in *dictum* that the
16 reasonable royalty calculation “permits and often requires a court to look to events and facts that
17 occurred thereafter and that could not have been known to or predicted by the hypothesized
18 negotiators,” *id.* at 1575, the court did not go beyond the limited *Georgia-Pacific* rule allowing
19 consideration of post-negotiation profitability as one of more than a dozen factors bearing on
20 whether a royalty is reasonable. Recently, in its discussion of *Georgia-Pacific* factor 11
21 concerning “[t]he extent to which the infringer has made use of the patent, *Georgia-Pacific*, 318
22 F. Supp. at 1120,” the Federal Circuit noted that “[c]onsideration of evidence of usage after
23 infringement started can, under appropriate circumstances, be helpful to the jury and the court *in*
24 *assessing whether a royalty is reasonable.*” *See Lucent*, 580 F.3d at 1333-34 (emphasis added).
25 Again, however, the court emphasized that the goal was to “recreate the *ex ante* licensing
26 negotiation scenario,” *id.* at 1325, and that evidence of actual use was only one piece of evidence
27 that could be used to support the reasonableness of a royalty analysis, *id.* at 1334 (noting that
28 evidence of post-infringement usage is one piece of evidence, along with “sales projections

1 based on past sales, consumer surveys, focus group testing, and other sources,” that could help to
2 estimate what the hypothetical negotiators would have believed about future usage).

3 But none of these cases hold—and the Federal Circuit has never suggested—that a court
4 could simply substitute post-negotiation market facts for the results of a hypothetical
5 negotiation—or, as here, the parties’ valuation during an actual negotiation—as the basis of a
6 royalty determination, as the approach in the Order suggests doing.

7 **B. The approach in the Order is incompatible with federal statutory and case law.**

8 In addition to the absence of support for the approach in the Order in appellate case law,
9 that approach is also incompatible with both federal statutory and case law in important respects.
10 *First*, by substituting the 2008-11 actual market value of Android features (which necessarily
11 would be measured as a percentage of Google’s actual Android profits) for the 2006 hypothetical
12 value of those features, the approach would effectively permit a disgorgement remedy that is
13 unauthorized by law. In 1946, Congress amended the patent-damages statute, 35 U.S.C. § 284,
14 with the specific purpose of eliminating an infringer’s profits as a measure of damages. *See*
15 *Georgia-Pacific*, 243 F. Supp. at 525-26 (purpose of the 1946 amendments was “eliminating the
16 infringer’s profits as an independent measure of the patent owner’s recovery”). Accordingly, the
17 *Georgia-Pacific* court noted that “Congress did not intend to aid a patentee in solving his
18 problem of proving the quantum of his damages by enabling him to substitute the quantum of the
19 infringer’s profits for the quantum of the patentee’s actual damages.” *Id.* at 519. Similarly, in
20 *Interactive Pictures*, the Federal Circuit explained that basing a reasonable royalty on *post hoc*
21 outcomes “would essentially eviscerate the rule that recognizes sales expectations at the time
22 when infringement begins as a basis for a royalty base as opposed to an after-the-fact counting of
23 actual sales.” *Interactive Pictures*, 274 F.3d at 1385; *see also Radio Steel*, 788 F.2d 1554 (Fed.
24 Cir. 1986) (holding that a reasonable royalty is based not on the infringer’s profit, but on the
25 result of a hypothetical negotiation at the time of infringement). The proposed approach in the
26 Order would substitute Google’s actual 2008-11 results for what was anticipated in 2006, and
27 then shift the burden to Google to persuade the jury not to rely on Google’s actual success as the
28 basis for determining a reasonable royalty. This is exactly what all the above authority rejects.

1 *Second*, the Federal Circuit has never used proof of actual outcomes as an end in itself; it
2 always has used such evidence as a check on experts' claims of reasonableness. *See Interactive*
3 *Pictures*, 274 F.3d at 1385; *Trans-World*, 750 F.2d at 1568. Put somewhat differently, the
4 Federal Circuit has made clear that if there is good evidence of what the parties anticipated at the
5 time of the hypothetical negotiation, then it does not matter whether those hopes were realized.
6 *Interactive Pictures* explicitly affirmed the use of "projections [that] would have been available
7 to [defendant] at the time of the hypothetical negotiation," while also holding that "[t]he fact that
8 [defendant] did not subsequently meet those projections is irrelevant to [defendant's] state of
9 mind at the time of the hypothetical negotiation." 274 F.3d at 1384-85.

10 In this case, there is substantial, credible evidence of the parties' expectations at the time
11 of alleged first infringement—namely, the months-long series of back-and-forth negotiations,
12 including the exchange of formal draft contracts, between Sun and Google in 2006. Those
13 negotiations are the proper basis of a reasonable royalty calculation under Federal Circuit law.
14 *See Stickle v. Heublein, Inc.*, 716 F.2d 1550, 1556-61 (Fed. Cir. 1983) (reversing district court's
15 damages award in part because "notably absent from [the district court's] findings is any
16 consideration of the actual negotiations between the parties"). By contrast, the approach in the
17 Order would use future market facts not as a check on the parties' reasonable expectations, but as
18 the basis for measuring the expectations. This would be damages based on "an after-the-fact
19 counting of actual sales"—exactly what *Interactive Pictures* prohibits. 274 F.3d at 1385.

20 **C. Because it was uncertain in 2006 whether Android would succeed or fail, the actual**
21 **market value of Android in 2008-11 is not a reasonable proxy for the expected**
22 **market value of Android in 2006.**

23 As the Court noted in its Order, even if the approach set forth in that Order were viable as
24 a matter of law, it would not make sense to use the actual 2008-11 value of Android as a proxy
25 for the expected 2006 value of Android unless "the marketplace events, as they eventually
26 unfolded, were reasonably predictable in 2006." Order at 2. But the market events of the past
27 three years were far from predictable at the time of the hypothetical negotiation.

28 In 2006, the smartphone market was in its infancy; none of the current dominant players,
including Apple's iPhone, had been introduced. Moreover, prior to developing and releasing

1 Android, Google had no track record in any facet of the smartphone market. It had never built or
2 released a smartphone operating system or a mobile applications framework, let alone a full-
3 stack operating environment like Android. Although the parties negotiated and the alleged
4 infringement began in 2006, the actual architecture and feature set of Android was undefined at
5 that point. Android was not even announced to the public until late 2007, and the first Android
6 phone not released until late 2008—two and a half years after the hypothetical negotiation.

7 During this long lag time, there was no guarantee that Android would succeed at all, and
8 substantial doubt throughout the industry and within Sun in particular. As Sun’s lead negotiator
9 Vineet Gupta admitted at his deposition, “[A] lot of our customers did not expect Android would
10 work, and they wanted to continue working with Java. So we didn’t see it as a threat at all at that
11 time [in 2008].” July 26, 2011 Gupta Dep. at 136:6-13. In 2008, Sun’s Chief Technology
12 Officer James Gosling disparaged Android as “a bag of code” with “no business plan, no phones,
13 no nothing . . . nobody is actually doing anything, nobody is actually shipping anything.” Trial
14 Ex. 3104 (<http://www.youtube.com/watch?v=thsklMITu0I>). Similarly, even on Android’s
15 release, most market analysts expected it to acquire at most 5-10% of the market, not over 40%,
16 as it has done. Leonard Report at 39 & n.148 (citing analyst reports concluding that “no one is
17 expecting Android to be a major success overnight,” with analysts such as J Gold Associates and
18 Gartner respectively predicting that Android would achieve only a 5% or 10% market share in
19 three years). Even as late as April 2010, Sun employees were dismissing projections of modest
20 success by Android—which projections are now dwarfed by actual adoption of Android—based
21 on initial Android sales. Trial Ex. 2229.

22 **D. The approach in the Order would not simplify Oracle’s apportionment task.**

23 Adopting the approach in the Order would not simplify the experts’ analysis, to the extent
24 it is even possible. In *Georgia-Pacific*, the court repeatedly explained that Congress’s primary
25 reason for abolishing an infringer’s profits as a basis for patent damages was that apportioning
26 such profits had proven “insoluble.” 243 F. Supp. at 521-22. As the court observed,

27 if [damages are] to be measured by the amount of the infringer’s profits, it would
28 require the ascertainment of those profits. This in turn would necessitate an
accounting for profits . . . which would be open to all the criticisms which were

1 leveled at such proceedings [including] *the often insuperable problem of*
2 *apportioning the infringer's total profits on the sale of a product between the*
3 *patented and nonpatented features..*

3 *Id.* at 525 (emphasis added).

4 Here, using the proposed framework, Oracle first would have to define the total 2008-11
5 value of Android, then isolate the percentage of that value provided by the patented features.
6 Then Oracle would have to separate out “other know how [that] may also be required to practice
7 the feature, such as licenses from other competitors and Google’s own independent know-how
8 contribution to developing that feature.” Order at 2. Critically, unlike in the case of the Sun IP
9 package, Oracle does not necessarily know every piece of Google engineering and know-how
10 that contributed to the relevant Android features. That know-how was not the subject of
11 discovery in this case. Further, the present value of Android and its features also reflects many
12 other factors besides enabling intellectual property and Google engineering—at least including
13 the strength of Google’s brand, its marketing efforts, and its relationships with its partners and
14 customers—which are also unrelated to the claimed inventions and must be subtracted away.

15 Even after all of these discounts were applied, the end result would be only the maximum
16 possible market value of the claimed inventions—*not* the result of a hypothetical negotiation.
17 Obviously, a party that licenses technology generally does not end up paying the maximum
18 market value of that technology, especially where it has alternative solutions (as Google did). It
19 is unclear how an expert could account for this negotiating reality, particularly since the Court
20 already rejected Oracle’s attempt to do so via the byzantine Nash Bargaining Solution.

21 By contrast, there is no reason Oracle could not have calculated, at least approximately,
22 the value of the various components of the Sun IP package. Oracle knows what those
23 components are; it understands how Sun valued them, both internally and in licensing; and it
24 understands their functional importance to the various Java technologies. It cannot claim that it
25 lacked the means to conduct the correct, legally mandated apportionment.

26 **E. Using the approach in the Order would lead Oracle to further inflate its damages.**

27 As discussed already, during the parties’ real-world negotiations in 2006, they exchanged
28 various proposals, each of which set an upper limit for the value of Sun’s intellectual property.

1 Oracle prefers Sun’s initial demand of \$100 million, while Google thinks it makes more sense to
2 use Sun’s final demand of \$28 million. Whatever the right baseline might be, both of these
3 numbers account to some extent for the parties’ actual 2006 expectations about the success of
4 Android. Accordingly, either figure is far more realistic as a measure of what a hypothetical
5 negotiation would have produced and thus far more legally sound. Basing a hypothetical
6 negotiation on the present market value of the Android platform, which would be the starting
7 point for valuing individual Android features under the Order, would only spur Oracle to take yet
8 another shot at posting the biggest possible—and still unsupportable—damages number.

9 **F. Other comments on the Order.**

10 *First*, if the Court does adopt the approach set forth in the Order, Google agrees it would
11 be Oracle’s burden to separate out the various “know-how inputs” that enabled each of the
12 allegedly patented features. Order at 2:21-28. Indeed, this point highlights yet another analytical
13 defect in Dr. Cockburn’s analysis, which mistakenly calculated the value of the accused *features*
14 of Android, which are enabled by many components other than the claimed inventions, rather
15 than the value of the allegedly infringed *intellectual property*. Google believes the evidence will
16 show that the real value of each of the features at issue is the result of Google’s work—most
17 obviously the source code written by Google engineers.

18 *Second*, for the reasons set forth in its brief in response to the Court’s December 6, 2011
19 tentative order, Google reaffirms that the second expert report of Dr. Cockburn should be largely
20 stricken and that Oracle should not get a third chance to draft a plausible damages report.

21 *Third*, with respect to the econometric and conjoint analyses Oracle used to apportion the
22 current market value of Android, Google did not challenge those analyses under *Daubert* only
23 because Google had a limited number of motions *in limine* available. Google requests
24 permission to file *Daubert* motions challenging the admissibility of those analyses.
